PUSHING THE LIMITS IN SENSITIVITY

Exceedingly sensitive.  
Sharply focused.

THE 6500 SERIES WITH IONDRIVE™ TECHNOLOGY

See what couldn't be seen. Until now. The new AB SCIEX 6500 LC/MS/MS series with multi-component IonDrive™ technology is the world's most sensitive triple quadrupole, improving sensitivity up to 10X and detector dynamic range by 20X over the best selling high performance triple quad – with no compromise in mass range.

Unique QTRAP® linear ion trap technology and optional SelexION™ differential ion mobility technology help enhance data quality and improve throughput while reducing the need for sample preparation. When merged with the Eksigent ekspert™ microLC 200 system, the functionally stackable design reduces lab space by 100%, while minimizing maintenance costs and reducing mobile phase costs by up to 95%.

The new AB SCIEX 6500 Series. It's the farsighted successor to a long line of leading AB SCIEX mass spec systems.

## FOREWORD

### The Bioanalysis Glossary

An essential new resource for bioanalysts!

The Future Science editorial team is delighted to bring you the first edition of The Bioanalysis Glossary, which we hope will be regarded as an essential resource for everyone who works in bioanalysis or related fields. Over 20 leading bioanalytical experts from industry and academia have been working closely with the Future Science editorial team over several months to develop this definitive glossary.

This guide will be particularly useful for those moving into the field or working with bioanalytical laboratories for the first time, and as a reference for experienced bioanalysts writing reports, research papers or presentations. Importantly, this glossary will aid in harmonization of the terminology used in the bioanalytical community within and between companies, universities and individuals. With increased globalization in drug development, it is now more important than ever before that scientists speak the same bioanalytical language.

For this glossary, bioanalysis is defined as the quantitative or qualitative measurement of analytes in biological matrices, including tissue, blood, serum, urine or other body fluids (and not the broader term used by biochemists for biochemical characterization).

We have included core bioanalytical terminology to ensure that it can be used consistently and – in recognition of the important role that bioanalysis plays in drug

development and other related fields such as metabolomics, antidoping testing and therapeutic drug monitoring – important terminology relevant to bioanalysis has also been included. This reinforces the fact that bioanalysis involves much more than just providing data – bioanalysts should be actively engaged in discussions relating to all stages of drug development, and a better understanding of related areas such as pharmacokinetics and how the data will be used leads to more insightful and useful bioanalyses.

Therefore, this glossary includes core established bioanalytical terminology, as well as definitions from related fields (e.g., pharmacokinetics and metabolomics) and pertaining to technology used in bioanalysis. Terms related to regulated bioanalysis are included, and recently introduced language that has now become commonplace is concisely defined. Some key examples of these include incurred sample reanalysis, dried blood spots and matrix effects.

It is our intention that this glossary will be updated when required to allow for the inclusion of new terms and to incorporate any changes to definitions. In this vane, we welcome your feedback and suggestions for future editions.

## SCOPE

In this glossary, bioanalysis is defined as the quantitative or qualitative measurement of analytes in biological matrices, including tissue, blood, serum, urine or other body fluids. The broader use of the term used by biochemists for biochemical characterization is excluded.

This glossary lists terms and definitions:

- Directly associated with the field of bioanalysis;
- That describe closely related techniques, technologies and applications of bioanalysis, which are important or useful for bioanalysts to understand.

It covers:

- General bioanalytical terms;
- (Bio)analytical techniques and equipment;
- Pharmacokinetics;
- Clinical trials;
- Metabolomics;
- Antidoping testing;
- Therapeutic drug monitoring;
- Regulatory and validation terminology;
- Drug development;
- Statistical terminology.

## TERMS & DEFINITIONS

### • 1 2D chromatography

Use of two **high-performance liquid chromatography (HPLC)** columns, typically in the heart-cut format, to resolve complicated bioanalytical issues such as **interference peaks** or **matrix effects**.

### • 2 absolute bioavailability

Extent of drug absorbed upon extravascular administration in comparison to the dose size administered (i.e., percentage absorbed).

### • 3 absorption

The process of uptake of a drug from the site of administration.

### • 4 accelerator mass spectrometry

A form of mass spectrometry that accelerates ions to very high kinetic energies before analysis, allowing separation of a rare isotope from an abundant neighboring isotope. It is used to study **drug metabolism** and in microdosing studies (i.e., **absolute bioavailability** and Phase 0 studies).

### • 5 acceptance criteria

Predefined criteria, such as for **accuracy** or **precision**, to be used for accepting or rejecting an experimental outcome.

### • 6 accuracy

The degree of closeness of the determined value to the nominal or known true value. Percentage **accuracy** is calculated as  $(\text{determined value}/\text{true value}) \times 100$ .

- 7 accurate mass

In mass spectrometry, determination of the mass of an **analyte** with sufficient **accuracy** to enable the elemental composition to be found.

Sponsored by

- 8 acid dissociation

**Sample pretreatment** step (often a decrease in pH) used to dissociate an **analyte** from a protein (e.g., drug–**antidrug antibody [ADA]** complexes), often used in conjunction with various **immunoassay/immunoextraction method** formats.

- 9 affinity-based biosensor

Device able to detect the concentration of **analytes** by their specific binding with several biotransducers, such as receptors, aptamers or antibodies.

- 10 alignment

The data processing step where one corrects for artifacts created by the analytical instrumentation, for example, **retention time (RT)** variations or shifts along the  $m/z$  axis between **samples**. **Alignment** is critical for all mass spectrometry (MS)-based detection methods and separation approaches as well as nuclear magnetic resonance (NMR) data from complex samples, because there must be one-to-one correspondence between the variables being compared in order to accurately ascertain the differences in the chemical compositions between samples.

- 11 analyte

A specific chemical moiety being determined, which can be intact drug, biomolecule or its derivative, **metabolite** and/or degradation product in a biologic **matrix**.

Sponsored by

- 12 **analyte fortification**

Addition of the compound of interest to the **biological matrix** for preparation of **calibration standard** or **quality control samples (QCs)**. A common informal term is ‘spiking’.

- 13 **analytical procedure**

The sequence of steps necessary to perform a complete analysis described in adequate detail to permit the procedure to be reliably and reproducibly performed by someone knowledgeable in the field. See also “**method**”.

- 14 **analytical range**

The range of concentration or other quantity values in the specimen over which the **method** is applicable without modification.

- 15 **analytical run**

A complete set of analytical and study **samples** with an appropriate number of standards and **quality control samples (QCs)**.

- 16 **anchor calibrator**

Standard point outside of the range of quantification, used to assist in fitting the nonlinear regression (e.g., 4-parameter or 5-parameter logistic) of the **standard curve** in **ligand-binding assays (LBA)**.

- 17 **antibody**

A protein molecule elicited in response to treatment with an **antigen** that is capable of binding to a specific determinant on the antigen. Also used as biotherapeutics.

- 18 **antibody–drug conjugate (ADC)**

Biologically active small molecule (payload) chemically linked with a monoclonal antibody (mAb).

WHEN CONSIDERING MS PERFORMANCE CLAIMS,  
BE MINDFUL OF THE FINE PRINT.

It's true! In the world of pharmaceutical bioanalysis, there's more than meets the eye. There are those who make bold claims. And those who deliver greater results. In the bold claims department, you'll hear about ultra-high resolution settings that are rarely if ever achieved—or that take too long to obtain. Then there are sensitivity measurements that don't hold up over time.

What can you do to avoid the false perception trap? Shine a spotlight on the truth.

And see where it takes you at [waters.com/DMPKpartner](http://waters.com/DMPKpartner)

Waters

THE SCIENCE OF WHAT'S POSSIBLE.®

• 19 **anticoagulant**

A substance added to the blood during sample collection to prevent blood clotting (coagulation).

• 20 **antidrug antibody (ADA)**

Also known as ‘antitherapeutic antibody’, a pre-existing or treatment-induced antibody that is capable of binding to the drug. Opiates, sulfa drugs and other small molecules can induce ADAs.

• 21 **antigen**

A substance eliciting the formation of antibodies in a suitable host.

• 22 **aptamer**

Nucleic acid molecule engineered to bind to various molecular targets. The mode of action of an aptamer is dependent upon its shape but not its sequence.

• 23 **aqueous normal-phase (ANP) liquid chromatography (LC)**

A variant of normal-phase **liquid chromatography** (in which the **stationary phase** is more polar than the **mobile phase**) for which the mobile phase components and additives are water-miscible. **Hydrophilic interaction liquid chromatography (HILIC)** and chromatography on silica hydride-based phases are popular examples of ANC LC.

• 24 **area under the curve (AUC)**

The area under the plot of **matrix** (e.g., **plasma**) concentration of drug against time after drug administration.

• 25 **assay-appropriate scientific validation**

One process of scientific validation where, irrespective of the stage of development in which the study is supported, assay criteria for scientific validation are defined to allow valid and documented decisions to be made from the reported concentrations.

- 26 atmospheric pressure chemical ionization (APCI)

A soft ionization technique for the production of gas-phase ions typically most efficiently with nonpolar small molecules involving nebulization of a liquid flow, application of a sheath gas and a corona discharge tip to place a charge on vaporized molecules. The produced ions are transferred into the vacuum interface region of a mass spectrometer for subsequent analysis.

- 27 audit

A systematic and independent examination of study- or trial-related activities and documents to determine whether the activities were conducted, and the data were recorded, analyzed, and accurately reported according to the **protocol**, **standard operating procedures (SOPs)**, **good laboratory practices (GLP)** or **good clinical practices (GCP)**, and other applicable regulatory requirement(s).

- 28 audit trail

An essential documented record, often automatically acquired, for an instrument, computer system or process that allows reconstruction of events in a chronological manner. Typically includes the date and time of an action, the user name and the action taken.

- 29 automation

The use of automated device(s) to perform part or all of a bioanalytical procedure.

- 30 autosampler

Part of an instrument (often a high-performance [or pressure] liquid chromatography [HPLC]) allowing the injection of **samples** in a reproducible and unattended manner.

- 31 back-calculation

Process of calculating the concentrations of calibration standards or **unknown samples** using their instrumental responses, according to the best-fitted line through the calibration points.

- 32 **balance**

A device used in a bioanalytical laboratory to weigh out solid and liquid materials, such as reference and **internal standards** or buffer components.

- 33 **basal value**

Measured value; such as, for a **biomarker**, before the administration of a drug.

- 34 **baseline**

The chromatographic signal of a system in the absence of an **analyte**.

- 35 **batch**

A number of study **samples** of unknown concentration along with the appropriate standards and **quality control samples (QCs)** that are processed at one time. See also “**analytical run**”.

- 36 **bias**

The difference between an experimental value and a nominal value expressed as a percentage, sometimes used as a measure of **accuracy** or trueness.  $\text{Bias (\%)} = [(\text{Experimental value} - \text{Nominal Value}) / \text{Nominal Value}] \times 100\%$ .

- 37 **bioanalysis**

The quantitative or qualitative measurement of analytes in biological matrices, including tissue, blood, serum, urine or other body fluids.

Sponsored by

**Thermo**  
SCIENTIFIC  
A Thermo Fisher Scientific Brand

- 38 **bioavailability**

The fraction of a drug that reaches the systemic circulation unchanged.

- 39 **bioequivalence**

Equivalence in the **plasma area under the curve (AUC)** of test and reference products.

- 40 **biolayer interferometry**

An analytical methodology based on a shift in the **interference** pattern of the light reflected through a **biosensor** resulting from biomolecular bindings on the biosensor surface.

- 41 **biologic/biotherapeutic/biopharmaceutical**

One of a diverse group of macromolecules with therapeutic potential that are usually derived from living organisms or systems and include monoclonal antibodies, proteins and peptides.

Sponsored by

- 42 **biological matrix**

A material of biological origin that can be sampled for the measurement of analytes, including blood, serum, **plasma**, urine, feces, cerebrospinal fluid, saliva, sputum and various tissues.

- 43 **biomarker**

Protein or small molecule indicative of homeostasis or a disease state that can indicate disease progression or a response to a therapeutic intervention.

Sponsored by

- 44 **biosensor**

Protein-based receptor that is linked to a detection system and allows for the measurement of an exogenously added ligand, often a protein.

- 45 **biosimilar**

Also known as 'follow-on biologic'. Subsequent version of an innovator biopharmaceutical product.

Sponsored by

- 46 **biotransformation**

Metabolic or catabolic changes to an administered drug in a biological system.

- 47 **blank sample**

A sample of a **biological matrix** to which no analytes and no **internal standard** have been added, which is used to assess the specificity of a bio-analytical **method** and to confirm absence of **contamination**.

- 48 **blood:plasma distribution ratio**

The extent to which a drug is distributed between **plasma** and the red blood cell fraction of blood, often expressed in the blood-to-plasma concentration ratio of the drug.

- 49 **bridging immunoassay**

**Immunoassay method** for detection of **antidrug antibodies (ADA)** that is enabled by the formation of a ternary complex or 'bridge' where one arm of the ADA binds to the capture reagent (e.g., solid phase adsorbed or biotin-labeled drug) and the second arm binds to the detection reagent (e.g., hapten-, **enzyme**- or ruthenium-labeled drug). Often the detection reagent is a labeled version of the capture reagent.

- 50 **calibration curve**

A set of calibration standards at various known concentrations whose measured instrument responses are used to construct a regression curve to measure concentrations of **incurred samples** and **quality control samples (QCs)**.

• 51 calibration range

The interval between the upper and lower concentration (amounts) of **analyte** in the sample (including these concentrations) for which it has been demonstrated that the **analytical procedure** meets the requirements for **precision** and **accuracy**. See also “**analytical range**”.

• 52 calibration standard

A **biological matrix** to which a known amount of **analyte** has been added.

• 53 capacity factor

Also known as ‘retention factor’,  $k$  (previously  $k'$ ); applies to isocratic column chromatography. A measure of chromatographic retention, for which the calculation involves both the **retention time** and the column void time.

DELIVERS A COMPLETE BIOANALYTICAL SERVICE FROM DISCOVERY TO REGULATORY SUBMISSION.

The LC-MS/MS, GC-MS & MSD specialists with full MHRA GLP & GCP accreditation.

[www.abslabs.com](http://www.abslabs.com)

# BIOANALYSIS AT ITS BEST

- 54 capillary zone electrophoresis

**Method** in which analytes are separated on a gel in a narrow-bore capillary, based on their differential migration due to their charge-to-size ratio. Separation is performed in a narrow-bore capillary generally filled with a buffer solution across which an electric potential is applied.

- 55 carryover

The inadvertent transfer of an **analyte** to a **blank sample** or other **samples** in a **batch**. Typically, this occurs following analysis of samples with a high **analyte** concentration.

- 56 cell-based neutralizing antibody assays

**Method** for the detection or quantitation of neutralizing **antidrug antibodies (ADA)** that block the functional properties of the drug. These assays utilize a cell line that is responsive to the drug either by directly responding to it or by responding to a ligand that shows altered activity in the presence of drug.

- 57 centrifugation

A process that involves the use of centrifugal force for the sedimentation of heterogeneous mixtures with a centrifuge. In **bioanalysis**, it is often used to separate blood from **plasma**, to separate protein precipitates from the liquid fraction, pellet suspended cells or to separate two immiscible solvents during **liquid–liquid extraction**.

- 58 certificate of analysis (CoA)

A document that shows the characterization of a **reference standard** and suitability to be used to support **good laboratory practice (GLP)**, **good clinical practice (GCP)** or **good manufacturing practice (GMP)** studies.

- 59 chiral chromatography

Chromatographic technique that is capable of separating enantiomers via diastereomeric complex formation with differential partitioning into the **mobile phase**.

- 60 chiral compound

A compound that contains an asymmetric center.

- 61 chromatogram

In chromatographic analyses, a graphic display of chromatographic output, typically showing the response as the y-axis and time as the x-axis.

- 62 chromatographic column

Essential component of a liquid or gas chromatographic system, containing the **stationary phase** and through which flows the **mobile phase**. Separation is typically effected through partitioning, adsorptive, electrostatic or affinity-based interactions between the **analyte** in the mobile phase and the stationary phase.

- 63 chromatography

A system using a **stationary phase** (see “**chromatographic column**”) and a **mobile phase** to effect separation of molecules in a given sample.

- 64 clinical laboratory improvement amendments (CLIA)

Regulates clinical laboratory diagnostic testing in the USA and requires clinical laboratories to be certificated.

- 65 clinical sample

A sample received from a patient or healthy volunteer (e.g., from a **clinical trial**) for **bioanalysis**.

- 66 clinical trial

Study to evaluate a new drug or treatment in healthy or diseased human subjects.

- 67 coadministered medicines

Two or more drugs administered concurrently to a subject.

- 68 coefficient of variation (CV)

A statistical term used for the measurement of **precision**. It is equivalent to **relative standard deviation (RSD)** and is calculated as (standard deviation/mean) × 100%.

- 69 **competitive ligand-binding assay**

An analytical methodology based on the competition of an **analyte** with an **endogenous compound** for a receptor or antibody ligand, which is linked to a detector system.

- 70 **compliance**

The adherence to **standard operating procedures (SOPs)**, **good laboratory practices (GLPs)**, **good clinical practices (GCPs)** or other regulatory standards. It is typically demonstrated through the accurate and complete record keeping of activities (e.g., sample custody and analysis) allowing for poststudy reconstruction and examination of the **raw data** and events.

- 71 **computer software validation**

A process of using predefined protocols and procedures to test the suitability and integrity of computer software for its intended use.

- 72 **contamination**

A phenomenon whereby **analyte** material from a known or unknown source (e.g., from another sample) accidentally enters a sample or analytical component that then enters the analytical system, and results in erroneous measurements.

- 73 **contract research organization (CRO)**

An organization that provides fee-based services to pharmaceutical and biopharmaceutical companies.

- 74 **core run**

A set of calibration standards and **quality control samples (QCs)** analyzed during assay validation to assess the **precision** and **accuracy** of the assay.

- 75 **counter ion**

A general term used to describe the ion with opposite charge to the **analyte**. May represent the ion used to form a salt or to improve chromatographic performance.

- 76 **critical reagent**

Essential component of an assay (particularly **ligand-binding assays [LBAs]**) whose characteristics are crucial to assay performance. These reagents, such as antibodies, peptides and conjugates, require thorough characterization and documentation, and may require significant amounts of time to acquire and/or to determine if suitable for use. They are usually **analyte**-specific, difficult to replace, and have a direct impact on the results of an assay.

- 77 **cross-reactivity**

In immunology, cross-reactivity refers to the reaction between an antibody and an **antigen** that differs from the antigen (**analyte**) of interest. It arises when a molecule (particularly a protein or peptide) has an **epitope** sufficiently similar to one on the analyte of interest to cause that molecule to bind to the antibody in a **ligand-binding assay (LBA)** in a similar way to the analyte of interest. Specificity is related to the concept of cross-reactivity. If an antibody is highly specific it has low cross-reactivity with analytes other than that of interest.

- 78 **cross-validation**

Comparison of performance of a (developed) **method** with a bioanalytical method through the analysis of the same set of **samples**. Cross-validation may include statistical comparisons of **quality control** and **incurred sample** results.

- 79 **cumulative urinary excretion curve**

Plot of the actual cumulative amount of drug excreted into urine versus time upon administration of a drug.

- 80 **curvature**

Within **linear regression**, the manifestation of a nonlinear (i.e., curvilinear) response versus concentration profile within a given concentration range for a quantitative bioanalytical **method**. From a statistical approach, curvature is the rate at which the slope changes. It is the second derivative of any function; for a straight line, the second derivative is '0', for a quadratic regression model (also a linear function), the rate is positive or negative.

• 81 **cut point**

The value at, or above, which instrument response is considered positive and below which response is considered negative.

• 82 **cytochrome P450**

A superfamily of heme-containing enzymes that can metabolize a variety of compounds via multiple pathways.

• 83 **daughter ion**

An electrically charged product of the reaction of a particular **parent ion** in mass spectrometry. Typically, occurs in mass spectrometric analysis in the reaction quadrupole as the result of high-energy interactions between the **analyte** and carrier gas. Also known as "**product ion**".

## Bioanalytical Services

We provide Bioanalytical support for all stages of drug development from preclinical studies (non-GLP and GLP) through all phases of clinical development (Phase I-IV) for both small and large molecules.

### LC-MS/MS Analysis of Small & Large Molecules

We have more than one hundred dedicated Bioanalytical scientists working with the latest equipment to ensure compliant and on-time regulatory submissions. We are continually expanding our extensive list of validated small molecule methods and have also validated multiple methods for large molecules using LC-MS quantification.

**Mass Spectrometry Equipment Includes:**

- Sciex QTrap 5500 with highly selective MRM3
- HRMS/QTOF AB Sciex TT5600

### Capabilities

- Bioanalytical Biomarker Quantification
- Biosimilars
- Drug-Drug Interactions
- Endogenous Compounds
- High Throughput Quantitative Methods
- Large Molecule Quantification by LC-MS
- Metabolite ID
- Protein Binding
- Tissue Analysis
- Unstable Metabolite Quantification

✉ [contact@algopharm.com](mailto:contact@algopharm.com)

🌐 [www.algopharm.com](http://www.algopharm.com)

• 84 **derivatization**

The chemical modification of functional groups to change the characteristics of compounds to be more favorable for analysis (e.g., more sensitive, differentiated from other molecules in the **matrix**, more specific, more volatile, fluorescent).

• 85 **diagnostic assay**

An assay appropriate to use in clinical decision-making for an individual patient. Such assays generally fall into one of six categories:

- Assays that screen for disease in an apparently healthy population;
- Assays used to aid in the diagnosis of a particular disease;
- Assays that monitor a disease or the efficacy of its treatment;
- Assays that stratify risk;
- Assays that prognose the natural course of a disease or condition;
- Assays that predict response to a therapeutic intervention.

• 86 **diastereoisomer**

Stereoisomers of a compound, with multiple chiral centers, that have different absolute configurations at one or more, but not all, chiral centers. Such compounds have different physicochemical properties, and, in theory, can be resolved under conventional methods of chromatography.

• 87 **digestion**

The enzymatic digestion of a macromolecule (usually protein) into smaller fragments (peptides) prior to analysis by mass spectrometry.

• 88 **dilution**

The procedure of adding control **matrix** to **incurred samples**. This process is used to bring incurred samples with concentrations above the **upper limit of quantification (ULOQ)** into the curve range for analysis.

# More compounds. More accurately. Faster than ever.

Today's range of possible therapeutic agents, from small molecules to peptides, to antibodies and ADC's, makes quantitative bioanalysis a challenge. Quantify potential therapeutics faster and more accurately with our new portfolio of LC-MS instruments, sample prep solutions and software. HRAM solutions using Thermo Scientific™ Orbitrap™ MS enables selectivity for complex molecules, while triple quadrupole MS delivers SRM sensitivity and speed to detect targeted compounds more quickly. Meet today's challenges with us and together, we'll transform quantitative bioanalysis.

## Quantitation transformed.

**Thermo Scientific™ Orbitrap Fusion™ MS**  
Unprecedented depth of analysis and throughput for biological discovery

**Thermo Scientific™ Q Exactive™ MS**  
Screen and quantify known and unknown targets with HRAM Orbitrap technology

**Thermo Scientific™ TSQ Quantiva™ MS**  
Leading SRM sensitivity and speed in a triple quadrupole MS/MS

- 89 dilution QC sample

**Samples** of control **matrix** spiked with **analyte** to which additional control matrix is added prior to analysis. Used to evaluate the acceptability of **incurred samples** analyzed after **dilution**.

- 90 discriminative metabolomics

The process of comparing the metabolites present in multiple **samples** collected under different conditions (e.g., disease states, drug treatment, among others) conducted to identify which metabolites are associated with the different conditions under which the samples are collected.

- 91 diversion of LC flow

Typically used to direct mobile eluent containing contaminants at a time point before the **elution** of the **analyte** of interest away from the LC-MS source. Usually a make-up mobile phase is directed to the LC-MS source while the eluent is diverted away in order to maintain instrument stability (e.g., avoid drying the curtain plate).

- 92 doping analysis

Laboratory procedures aimed at ascertaining the use of banned performance-enhancing substances and methods in sport by the analysis of biological fluids.

- 93 dosage regimen

The systematized schedule under which compounds are administered for therapy; that is, the proper compound mass and proper time interval between compound administration required to produce clinical effectiveness or to maintain a therapeutic concentration in the body.

- 94 dose–response curve

The graphical presentation of pharmacological response versus amount of compound administered (e.g., dose).

## Samples are complex. Separating them shouldn't be.

Every breakthrough starts with a challenge. We believe that challenge should be your science, not your instrument. The **Thermo Scientific™ Vanquish™ UHPLC** delivers better separations, more results, and easier interaction than ever before. In 2010 we embraced UHPLC as the standard for all of our liquid chromatography solutions, and we have designed the Vanquish UHPLC as the instrument to solve your chromatographic challenges and achieve that breakthrough.

### Vanquish UHPLC System

• Discover more at [thermoscientific.com/Vanquish](http://thermoscientific.com/Vanquish)

**Thermo Scientific™  
Accucore™ Vanquish™ Columns**

1.5 µm solid core particles for unmatched resolution and throughput

**Leading Separations for  
Mass Spectrometry**

Providing that extra level of confidence with seamless integration

**Thermo Scientific™ Dionex™ Chromeleon™  
Chromatography Data System**

Operational simplicity with eWorkflows and simplified data handling

- 95 **dosing interval**  
The time period between multiple administrations of a compound.
- 96 **dosing vehicle**  
Substance used to facilitate the **absorption** or administration of the drug.
- 97 **dried blood spot (DBS) sampling**  
A **matrix** sampling methodology based on applying whole blood (e.g., obtained from a heel-, tail- or finger-prick) onto a (paper) substrate which is subsequently dried and sealed in bags with desiccant for possible storage and shipping prior to extraction and analysis.
- 98 **drug metabolism**  
See “**biotransformation**”.
- 99 **drug–drug interaction**  
The effect of other drugs on the **pharmacokinetics (PK)** and **pharmacodynamics (PD)** of the coadministered drug.
- 100 **dry-down**  
The evaporation of solvents, typically organic, during the sample preparation process.
- 101 **electrochemiluminescence**  
An analytical methodology based on the detection of light generated during electrically stimulated chemical reactions of compounds in solution.
- 102 **electrospray ionization (ESI)**  
A soft ionization technique useful for dealing with nonvolatile or thermally labile molecules. Instead of fragmenting the molecule into many smaller charged particles making subsequent interpretation difficult, it ionizes the molecule through the generation of small droplets, which are then analyzed in the gas phase by mass spectrometry.

# No variability

SOLA $\mu$  plates are designed for bio-analytical and clinical research analyst's who consistently require cleaner, highly reproducible and robust sample extraction at very low sample volumes. Our award winning fritless SPE technology removes variability and optimizes your high throughput laboratory workflow.

## just consistency

- When your sample volume is critical visit:

Greater sample success at low elution volumes due to high reproducibility

Providing confidence in your analytical results

- 103 **elimination half-life**

After equilibrium is reached, the time necessary to reduce the drug concentration in the **plasma** to one-half.

- 104 **elution**

The process of desorbing an **analyte** from a **stationary phase** with a **mobile phase**.

- 105 **enantiomer**

One of two stereoisomers that are mirror images of each other (i.e., nonsuperimposable/not identical).

- 106 **endogenous compound**

Components naturally present in biological fluids obtained from animals or humans.

- 107 **enzyme**

Proteins that speeds up the rate of a chemical reaction in a living organism.

- 108 **enzyme induction**

The increase in the rate of enzymatic processes resulting in faster metabolism of a compound. If a drug stimulates its own metabolism, it is called autoinduction.

- 109 **enzyme inhibition**

The decrease in the rate of metabolism of a compound usually by competition for an **enzyme** system.

- 110 **enzyme-linked immunosorbent assay (ELISA)**

A form of **immunoassay**.

# no smear, no smudge No question.

Your lab revolves around ensuring accurate data and reliable results. Current methods for vial sample labeling can be illegible or time consuming. No accurate and efficient system for vial sample identification existed ...until now. The **Thermo Scientific™ Virtuoso™ Vial Identification System** provides a fast, accurate, detailed and reproducible system for imaging information directly onto a vial. Discover how much more information, and confidence, you can have in your sample ID.

## Expect more confidence.

© 2014 Thermo Fisher Scientific Inc. All rights reserved. All trademarks are the property of Thermo Fisher Scientific and its subsidiaries.

- 111 **epimer**

Stereoisomer with more than one chiral center that differs in the configuration at only one center.

- 112 **epitope**

The part of an **antigen** that is recognized by the immune system (i.e., antibodies, B or T cells).

- 113 **error**

The difference between an estimate of a quantity and its true value. This difference (positive or negative) may be expressed either in the units in which the quantity is measured or as a percentage of the true value.

- 114 **European Medicines Agency (EMA)**

Regulatory body responsible for the protection of public and animal health in the European Union through the scientific evaluation and supervision of medicines.

- 115 **excretion**

The final elimination of a compound and its metabolites from the body's systemic circulation via the kidney into urine and via bile into feces.

- 116 **extractability**

The extent to which an **analyte** can be recovered from a **biological matrix**.

- 117 **extrapolation**

The estimation of the concentration of an **unknown** sample outside the established **calibration range**, on the basis of the observed relationship between the **nominal concentration** of the calibrators and the instrumental response and under the assumption that this relationship will also be applicable outside the calibration range.

- 118 **false negative**

A false-negative result for a sample indicates that the sample gives a test result of ‘negative’ for an **analyte** of interest although the analyte is actually present in the sample or is present in a concentration above the **cut point** of the assay.

- 119 **false positive**

A false-positive result for a sample indicates that the sample gives a test result of ‘positive’ for an **analyte** of interest although it is not actually present in the sample or is present in a concentration below the **cut point** of the assay.

- 120 **FDA Form 483**

A form used by the **US FDA** to document and communicate concerns discovered during their inspections.

- 121 **fingerprinting**

A multivariate pattern expressed in the data that can be applied for sorting datasets into categories so that conclusions can be drawn about classification of individual samples.

- 122 **first-in-human (FIH)**

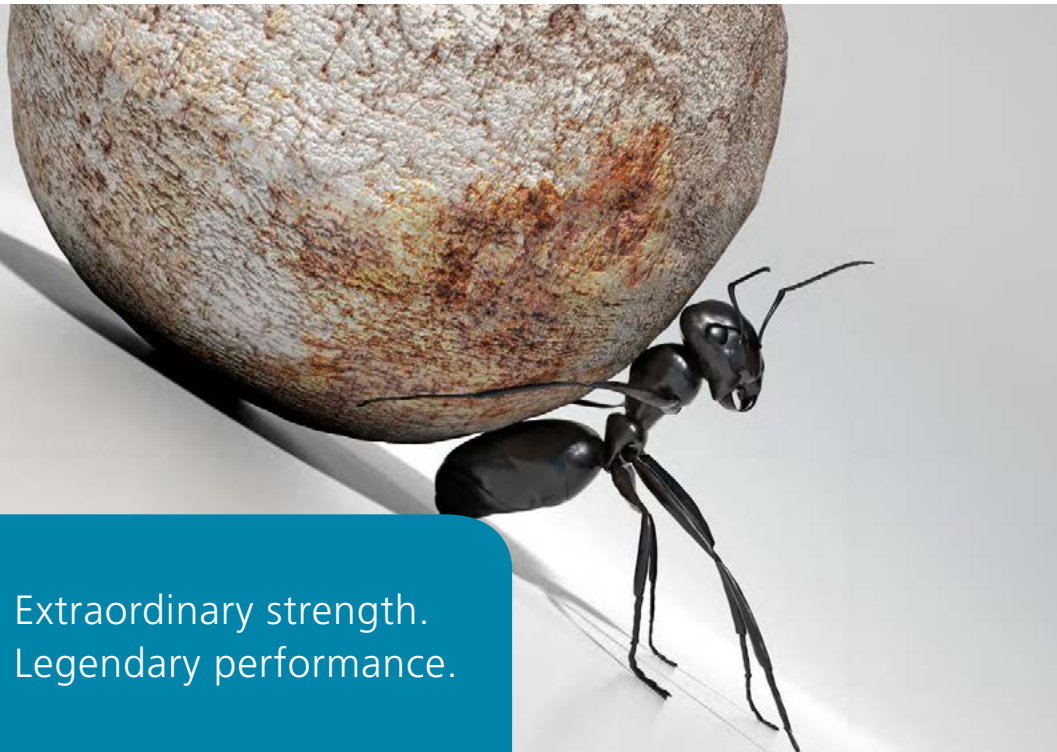

**Clinical trial** where a medical procedure, previously developed and assessed through *in vitro* or animal testing, or through mathematical modeling is tested on human subjects for the first time.

- 123 **first-pass effect**

The phenomenon where drugs may be metabolized following **absorption** from the GI tract but before reaching systemic circulation.

- 124 **fit-for-purpose**

Qualification of a bioanalytical **method** with scientific rigor for the intended purpose where all applicable parameters may not be evaluated as per regulatory guidance. See also “**tiered approach**”.

Extraordinary strength.  
Legendary performance.

INTRODUCING THE NEW LC/MS/MS WORKHORSE

Real-world labs need an industrious LC/MS/MS workhorse for trustworthy results hour after hour, day after day. The new AB SCIEX 4500 Series takes the legendary API 4000™ triple quad platform and intelligently re-engineers it to set a new benchmark for reliable quantitation. And, with 10X increase in sensitivity over competitive triple quads in the same class, the legend gets better and better.

Also available with unique QTRAP® technology, the 4500 delivers 100X more full-scan MS/MS sensitivity than standard triple quads for unmatched simultaneous quantitation and library searching. Whether your research is focused on food and environmental contaminant screening, clinical research, regulated bioanalysis or targeted quantitative proteomics, the 4500 will deliver reliable, robust and definitive results with a new level of confidence.

Combined with accelerated lab integration packages, which merge LC, application software, and validation services into comprehensive workflows specific to your application, the AB SCIEX 4500 Series more than carries its weight.

Explore the new workhorse at [www.absciex.com/SEA](http://www.absciex.com/SEA)

- 125 **flow cytometry**

Laser-based analytical technique used for cell counting, cell sorting and **biomarker** detection.

- 126 **free drug**

Drug in the body that is not bound to a protein (e.g., albumin), target or antibody.

- 127 **full validation**

Establishment of all validation parameters for a particular **analyte(s)** in accordance with health authority regulations.

- 128 **functional neutralizing antibody assay**

A **neutralizing antibody** binds to distinct functional domains of a therapeutic protein and blocks its activity or function. A functional neutralizing antibody assay detects if the **antidrug antibody** neutralizes the drug activity.

- 129 **gas chromatography (GC)**

Chromatographic technique using a carrier gas, typically helium or hydrogen, as **mobile phase**, where the injected liquid sample is typically immediately vaporized in the injection port. The walls of the column are coated with a thin viscous liquid layer, the **stationary phase**, on an inert solid support.

- 130 **good clinical practice (GCP)**

A standard for the design, conduct, performance, monitoring, auditing, recording, analysis and reporting of clinical trials that provides assurance that the data and reported results are credible and accurate, and that the rights, integrity and confidentiality of trial subjects are protected.

- 131 **good laboratory practice (GLP)**

A set of regulations that provides a framework within which laboratory studies are planned, performed, monitored, recorded, reported and archived.

Sponsored by

- 132 **good manufacturing practice (GMP)**

A set of regulations that provides a framework within which manufacturing of drugs, food and active pharmaceutical ingredients is planned, performed, monitored, recorded, reported and archived.

- 133 **gradient elution**

Increase of the **elution** strength by either linearly or step-wise changing the **mobile phase** composition (e.g., increasing acetonitrile percentage for a mobile phase used for reversed-phase elution).

- 134 **hematocrit**

The volumetric proportion of red blood cells in blood.

- 135 **hemolysis**

Lysis (rupture) of red blood cells resulting in release of hemoglobin and other cellular matter into the plasma.

- 136 **hepatic clearance**

The hypothetical volume of distribution in milliliters of unchanged drug cleared in 1 min via the liver.

# Drug development services

## Bioanalytical sciences

[www.lgcgroup.com](http://www.lgcgroup.com)

- 137 **high-performance (or pressure) liquid chromatography (HPLC)**

Chromatographic technique where the sample is injected onto a liquid **mobile phase**, which is pumped at high pressure through a column, packed with adsorbent material (**stationary phase**).

Sponsored by

**Agilent Technologies**

- 138 **high-resolution mass spectrometry (HR-MS)**

Mass spectral analysis with resolution  $>10,000$  full-width at half-maximum where resolution =  $m/\delta m$ , with  $m$  being mass and  $\delta m$  the full width of the peak at half its maximum height (FWHM).

Sponsored by

- 139 **homogenate**

Suspension of tissue cellular fragments and constituents obtained after the tissue is homogenized, lysed, sonicated and/or digested.

- 140 **homegenization**

Technique used to homogenize tissues, which can be mechanical, sonication, bead beating and/or enzymatic.

- 141 **hydrophilic interaction liquid chromatography (HILIC)**

A variant of normal-phase chromatography that uses hydrophilic (polar) **stationary phase** and hydrophobic (mostly organic) **mobile phase**. Retention increases with hydrophilicity of analytes and the order of **elution** is opposite to that obtained with **reversed-phase chromatography**.

- 142 **hydrophobic interaction liquid chromatography (HIC)**

A form of chromatography whereby a **matrix** containing hydrophobic groups binds proteins from aqueous solutions to different extents depending on the protein structures and a range of controllable factors including concentrations of salts, pH, temperature and organic solvents.

- 143 **hyperlipidemia (lipemia)**

Abnormally high levels of lipids and/or lipoproteins in blood, often associated with genetic factors and diabetes. **Bioanalysis** of hyperlipidemic **samples** may be compromised due to the lipid content and **method** performance is typically checked using a spiked blank hyperlipidemic **matrix**.

- 144 **immunoaffinity chromatography**

Combines **liquid chromatography** with the specific binding of antibodies or related agents. The **method** can be used in assays for a particular target or for purification and concentration of analytes prior to further examination by another technique.

Sponsored by

- 145 **immunoassay**

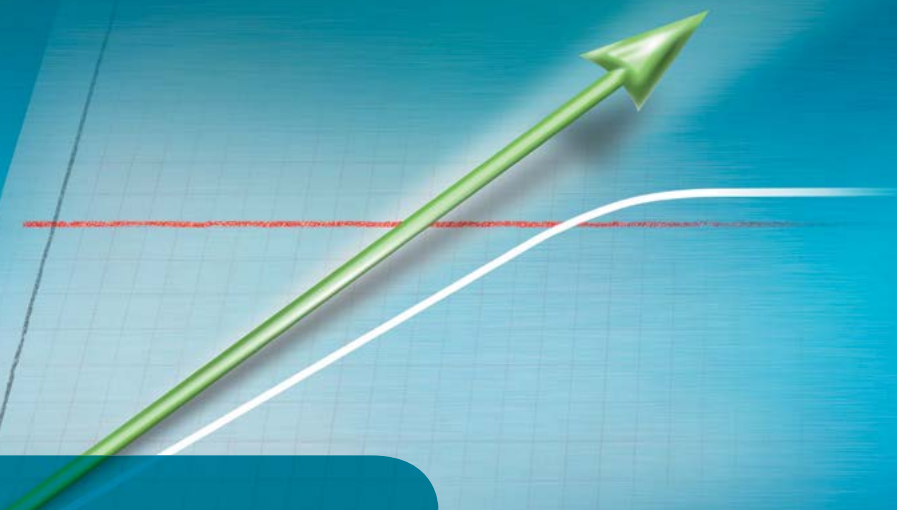

Assay using antibodies to detect or quantify an **analyte**.

- 146 **immunocapture**

Direct capture of a molecule onto a surface coated with an antibody to the molecule.

- 147 **immunogenicity**

The ability of a molecule (e.g., protein, nucleic acid, carbohydrate, lipid or small drug molecule) to provoke an immune response in the body of a human or animal.

Extend the curve  
in your favor

THE 6500 SERIES WITH IONDRIVE TECHNOLOGY

See what could not be seen - until now. Equipped with a High Energy IonDrive™ detector, the new AB SCIEX 6500 LC/MS/MS Series delivers up to 6 orders of linear dynamic range. This advanced performance extends your upper limit of quantitation and reduces the need for reanalysis. AB SCIEX's most sensitive triple quadrupole ever produced extends the curve in your favor.

**Use our LDR calculator to see how much at [www.absciex.com/6500-LDR-ROI](http://www.absciex.com/6500-LDR-ROI)**

**AB SCIEX**

- 148 immunogenicity assay

**Method** to detect an immune response to an administered therapeutic drug (usually a protein) in biological fluids (usually serum or **plasma**).

- 149 imprecision

Equivalent meaning to **precision**, the standard deviation or **coefficient of variation** of the results in a set of replicate measurements.

- 150 *in vitro*

Experiments performed outside of living bodies by using cells or artificial culture medium.

- 151 *in vivo*

Experiments conducted using living bodies.

- 152 inaccuracy

Numerical difference (positive or negative) between the mean of a set of replicate measurements and the true value.

- 153 incurred sample

Study sample from subjects or animals.

- 154 incurred sample reanalysis

Repeated measurement of **analyte** concentration from a portion of the incurred study **samples** from dosed subjects to determine whether the original analytical results are reproducible.

- 155 in-source fragmentation

Fragmentation of the molecule in the LC-MS interface. Typical examples of in-source fragmentation include loss of a glucuronide or loss of water.

- 156 instrument qualification (IQ/OQ/PQ)

A process that tests the suitability of the given instrument(s) and associated software/hardware for their intended usage by following a predefined **protocol**.

- 157 interassay precision

**Precision** of the measurement of an **analyte** between separate assay occasions, analysts or equipment.

- 158 interference

The effect of components present in the **samples** on the **accuracy** of measurement of another component.

- 159 interim data

A report of results and their evaluation based on analyses performed during the course of a trial or experiment prior to their completion.

- 160 intermediate precision

A measure of **precision** that reflects within-laboratory variations: different days, different analysts, different equipment, among others.

- 161 internal standard

Test compound(s) (e.g., a structurally similar analogue, or stable isotope-labeled compound) added to calibration standards, **quality control samples (QCs)** and study **samples** at a known and constant concentration to correct for experimental variability during sample preparation and analysis.

- 162 interpolation

The means of calculating the concentrations of incurred and **quality control samples (QCs)**, through the established back-calculated line of regression of **nominal concentration** against instrumental response.

- 163 intra-assay precision

**Precision** of the replicate measurement of an **analyte** within a single assay occasion.

- 164 **intravascular administration**

All routes of administration where the drug is directly introduced into the blood stream.

- 165 **intrinsic clearance**

Theoretical unrestricted maximum clearance of unbound drug by an elimination organ.

- 166 **Investigational New Drug (IND)**

The means by which a pharmaceutical company obtains permission to ship an experimental drug across state lines (usually to clinical investigators) before a marketing application for the drug has been approved. The **US FDA** reviews the IND application for safety to assure that research subjects will not be subjected to unreasonable risk.

- 167 **Investigator's Brochure (IB)**

A compilation of the clinical and nonclinical data on the investigational product(s) that is relevant to the study of the investigational product(s) in human subjects.

- 168 **ion-exchange chromatography**

Chromatographic separation based on the charge of the analytes.

- 169 **ion-mobility spectrometry**

Technique used to separate ions based on relative mobilities in a drift cell with electric field and carrier buffer gas. The mobility of an ion depends on cross-sectional area, shape and charge.

- 170 **ion-pairing chromatography**

The use of strongly ionic additives, typically in a **mobile phase**, that undergo electrostatic binding to oppositely charged analytes. A frequent goal of ion pairing in chromatography is to reduce or eliminate adverse peak shape, particularly tailing, caused by a positively charged **analyte** interacting with secondary silanols on a silica-based column.

# Bioanalysiszone

# Spotlights

Bioanalysis Zone Spotlights provide focused coverage on topical and interesting subject areas; giving you access to exclusive content and live events.

Our Spotlights cover a range of exciting and relevant fields such as:

- microsampling
- matrix effects

Upcoming spotlights include focuses on:

- automation
- antibody–drug conjugates
- LC–MS derivatization

Check out our Spotlights:  
[www.bioanalysis-zone.com](http://www.bioanalysis-zone.com)

- 171 **ion-pairing reagent**

A reagent used in ion-pairing chromatography to selectively modify and increase the retention of charged analytes. Typically includes a hydrophobic tail with an ionizable head group whose charge is opposite that of the **analyte** that when complexed produces a neutral complex of improved chromatographic properties.

- 172 **ion suppression**

Reduced detector response in mass spectrometry as a result of competition for ionization between the **analyte** of interest and **matrix** components.

- 173 **ion trap mass spectrometer**

A mass spectrometer with an analyzer that traps ions in a cell and scans appropriate ranges to eject according to  $m/z$ .

- 174 **isobaric isomers**

Compounds with identical molecular weights but different spatial configurations.

- 175 **isocratic elution**

A chromatographic **elution** using a single and consistent **mobile phase** composition.

- 176 **isotope dilution**

An isotopically enriched substance is added to an analytical sample. The ratio of the **dilution** of the isotope can then be used to determine the amount of **analyte** in the sample.

- 177 **isotopologue**

An isotopically labeled analogue of a given compound.

- 178 **lab-on-a-chip**

See “**microfluidics**”.

- 179 laboratory information management system (LIMS)

Software package utilized in bioanalytical laboratories as a central database for sample management and analysis.

Sponsored by  **Agilent Technologies**

- 180 ligand-binding assay (LBA)

Quantitative **method** based on the binding of ligand molecules to antibodies or receptors, typically used for biomolecules where the reliance is on highly specific **epitope–paratope** interactions between **antigen** and antibody.

- 181 limit of detection (LOD)

The lowest concentration of an **analyte** that a bioanalytical procedure can reliably differentiate from background noise. Commonly defined by a signal-to-noise ratio of 3.

- 182 linear regression

An approach for modeling the linear relationship between concentration and instrument response (typically the ratio between **analyte** and **internal standard**).

- 183 liquid chromatography (LC)

Chromatographic technique that employs a liquid mobile phase, a liquid sample injected, and a packed column **stationary phase** of appropriate chemistry for the required selectivity. This technique can be coupled to a variety of detectors, most notably mass spectrometry for **bioanalysis**.

- 184 liquid–liquid extraction

Means of sample extraction that relies on the partitioning of an **analyte** between an aqueous component and a water-immiscible organic component.

# HybridSPE<sup>®</sup>-Phospholipid Technology

Selectively remove phospholipids and proteins  
for more accurate and reproducible LC-MS  
results with your bioanalytical assays

See the proof.  
Request an evaluation sample at  
[sigma-aldrich.com/  
hybridspe](http://sigma-aldrich.com/hybridspe)

- 185 **locked nucleic acid (LNA)**

Oligonucleotide containing one or more of the 2'-O,4'-C-methylene- $\beta$ -D-ribofuranosyl nucleosides called LNA monomers. The major feature of LNAs is the high-affinity hybridization to complementary nucleic acids because of high thermo-stability, resulting in enhanced selectivity and assay sensitivity.

- 186 **lower limit of quantification (LLOQ)**

The lowest amount of **analyte** in a sample that can be quantitatively determined with predefined **precision** and **accuracy**.

- 187 **mass spectrometer transition**

The representation of the **parent ion** nominal mass to the measured fragment ion in a triple quadrupole or time-of-flight (TOF) mass spectrometer (e.g., 842 $\rightarrow$ 456).

- 188 **mass-to-charge ( $m/z$ )**

The characteristic of a molecule or molecular fragment that represents its nominal mass divided by the number of charges the molecule carries. This value is typically used to represent the parent and **product ions** in mass spectrometry assays and is used to define the nominal mass settings for the filtering of the **analyte** out of the mixture of all present ions.

- 189 **master schedule**

A GLP requirement for all nonclinical laboratory studies conducted at the testing facility indexed by test article and containing the test system, nature of study, date study was initiated, current status of each study, the identity of the sponsor and name of the **Study Director**.

- 190 **matching matrix**

Blank **biological matrix** or **matrix** surrogate prepared from a recipe, used for the preparation of **calibration standard** and **quality control samples (QCs)**, intentionally similar to the matrix of **incurred samples** requiring analysis. Matrix matching is often used in tissue analysis where blank tissue is unavailable or limited to best compensate for **matrix effects**.

- 191 **matrix**

Whole blood, **plasma**, serum, urine, or other **biological matrix** selected for analysis. A **matrix** not containing exogenous chemicals (except **anticoagulant**) and their metabolites is called blank matrix.

- 192 **matrix effect**

The direct or indirect alteration or **interference** in instrumental response due to the presence of **matrix** constituents in extracted **samples** or unextracted samples for LBAs), which the overall **method** selectivity is inadequate to address.

Sponsored by **SIGMA-ALDRICH®**

- 193 **matrix factor (MF)**

The ratio of the **analyte** response in the presence of **matrix** to the response in the absence of matrix.  $MF = \text{analyte response in the presence of matrix} / \text{analyte response in the absence of matrix}$ .

- 194 **metabolite**

An intermediate and product of metabolism; in **bioanalysis**, this usually refers to a product of the metabolism of an administered therapeutic, but metabolites can also be products of metabolism of other exogenous or endogenous substances.

- 195 **metabolite features**

Peaks with a unique mass-to-charge ratio or deconvoluted as a cluster of different mass spectrometry (MS) species (adducts, neutral losses) corresponding to a unique mass-to-charge ratio, a unique **retention time** and with an intensity value (or area under the peak).

- 196 **metabolite profiling**

The measurement of all low-molecular-weight metabolites and their intermediates in a biological system. See also "**metabolomics**".

- 197 **metabolites in safety testing (MIST)**

The detection, confirmation and comparison of the exposure of drug metabolites observed in human clinical trials with those observed in animal studies. Used to establish the safety of the human metabolites through demonstrating adequate exposure in animal species.

Sponsored by

- 198 **metabolome coverage**

The ability of an analytical technique to detect all metabolites (endogenous or exogenous) in complex biological **samples**. No technology can currently provide analysis of all analytes in such samples, and as a result, a combination of techniques is required to increase metabolome coverage.

- 199 **metabolomic biomarker**

An endogenous **metabolite** whose concentration changes in response to disease or treatment thereof. Such metabolites can be used for the purpose of diagnosis, disease subcategorization, prognostication and prediction of therapeutic sensitivity to treatments.

- 200 **metabolomics**

Often used interchangeably with the term ‘metabonomics’, is an analytical strategy that entails the comprehensive analysis of the low-molecular-weight compounds (<1000 Da) involved in the metabolic networks of living organisms and their response to pathophysiological or other stimuli. This methodology involves the use of advanced **metabolite profiling** techniques, such as **nuclear magnetic resonance (NMR) spectroscopy** and/or mass spectrometry hyphenated or not with a separation technique such as GC, LC or capillary electrophoresis (CE), combined with multivariate statistical analysis.

- 201 **meta-metabolomics**

Quantitative analysis of **metabolite** patterns in a complex host–microbiome system (including multiple partners); for example, used to identify metabolic networks related to health or disease issues.

TOGETHER. IT'S HOW WE WORK. IT'S HOW WE SUCCEED.

and request the **Early ADME Solutions Guide**.

© Agilent Technologies, Inc. 2014

- 202 **method**

A comprehensive description of all procedures used in sample analysis.

- 203 **method qualification**

Subset of the validation processes that verifies **method** performance to demonstrate that an analytical method is working according to predefined **acceptance criteria**.

- 204 **method validation**

A comprehensive set of experiments to investigate whether an analytical **method** is functioning according to predefined **acceptance criteria**. For **regulated bioanalysis** criteria should be in **compliance** with guidelines published by regulatory authorities.

- 205 **micellar electrokinetic chromatography**

Electrodriven separation technique where an ionic surfactant, generally sodium dodecyl sulfate (SDS), is added to the separation buffer at a higher concentration than its critical micelle concentration and micelles act as a pseudo-stationary phase allowing solute partition simultaneously to electrophoretic separation.

- 206 **microbore column**

A **chromatographic column** with a small inner diameter ( $\leq 1$  mm), which is operated at lower **mobile phase** flow rates than a conventional column and provides increased detection sensitivity. It is attractive for the analysis of small volume (or low concentration) **samples**.

- 207 **microflow**

Microliter flow rates (usually  $\leq 50$   $\mu\text{l}/\text{min}$ ) employed in chromatographic separations with **microbore columns**.

- 208 **microfluidics**

A field of technology using systems in which very small volumes of fluids are handled. For **bioanalysis**, this term usually refers to miniaturized devices that contain small flow channels and that combine one or multiple analytical functions in a single device. Also known as "**lab-on-a-chip**".

Sponsored by

**Waters**  
THE SCIENCE OF  
WHAT'S POSSIBLE.®

- 209 **microsample**

Sample of blood or any other **biological matrix** in the low  $\mu\text{l}/\mu\text{g}$  range utilized for certain preclinical or clinical studies, particularly with small animals or children.

- 210 **mixed-mode**

The use of multiple retentive modes to effect a separation, pertaining to a chromatographic or solid-phase extraction process. For example, ion-exchange can be performed in conjunction with reversed-phase partitioning.

- 211 **mobile phase**

In chromatography, the liquid or gas that moves through or along the **stationary phase** of a column. Separation of a mixture of analytes is achieved by differences in their partitioning between the mobile and stationary phases.

- 212 **molecularly imprinted polymer (MIP)**

An artificial affinity material consisting of a synthetic polymer, which is formed in the presence of a compound (the template), that is later removed and thus leaves specific binding sites for the template and structurally related molecules.

# Bioanalysis WEBINAR

Have you seen our free webinars?

Bioanalysis Zone educational webinars are an excellent way to stay abreast of new technologies and services in the rapidly evolving bioanalysis field.

From the comfort and convenience of your home or office, our webinars allow you to hear from international experts on key areas of research and technology, and stay up-to-date with new advances – free and on a schedule that suits you.

Get involved – join  
Bioanalysis Zone  
to listen to our  
webinars

- 213 **monolith**

A solid support that consists of a single piece of porous material characterized by a bimodal pore size distribution (macroporous and mesoporous), which confers favorable mass transfer properties, a large surface area and low pressure drops suitable for use in analytical or purification methods.

- 214 **multi ascending dose (MAD; also known as 'multiple ascending dose')**

A drug is given repeatedly at intervals shorter than those required to completely eliminate the drug from the previously given dose. This dosing is used to study the **pharmacokinetics (PK)/pharmacodynamics (PD)** of multiple doses for safety and tolerability. The dose is increased over time to a predetermined maximal level.

- 215 **multiple reaction monitoring (MRM)**

A quantification strategy used in **tandem mass spectrometry** in which an **analyte** ion with a particular mass-to-charge ratio (the **precursor ion**) is selected by a first quadrupole (Q1) in the mass spectrometer, and more than one product of a collision-induced dissociation reaction, each with a particular mass-to-charge ratio (the **product ion**), are selected in another quadrupole (Q3) and detected.

- 216 **multiplexing**

The ability of an analytical technique or device to process or analyze multiple **samples** simultaneously. This term also refers to the determination of multiple analytes using the same assay or run, such as a panel of biomarkers.

- 217 **multi-site study**

Any study that has phases conducted at more than one site.

- 218 **nanoflow**

Nanoliter per minute flow rates employed in chromatographic separations with very narrow-bore capillary columns ( $\leq 500$  nm i.d.).

- 219 **nanofluid liquid chromatography**

A liquid chromatographic **method** employing **mobile phase** flow at very low flow rates (nl/min).

- 220 **neutralizing antibody (NAb)**

An antibody that is formed *in vivo* in response to treatment with an **anti-gen** and that binds to a drug and blocks its function. For an **enzyme** drug, a neutralizing antibody would block its action on the substrate. For an agonist or antagonist drug, an antibody that blocks the drug binding to its ligand would neutralize the drug. Antibodies that bind to epitopes on a drug that do not affect the function of the drug are non-neutralizing antidrug antibodies.

- 221 **New Drug Application (NDA)**

A process in the USA through which drug sponsors formally apply for approval by the **US FDA** for the sale and marketing of a new pharmaceutical.

- 222 **nominal concentration**

Theoretical or true concentration.

- 223 **non-cell-based neutralizing antibody (NAb) assay**

Analytical technique to assess the presence of neutralizing antidrug antibodies in a sample without using intact cells for analysis. Typically, such an assay uses the isolated drug target coated onto a plate and generates an analytical response upon binding of the drug to its target. The presence of a neutralizing **antidrug antibody** will interfere with the ability of the drug to bind to its target, resulting in a measurable change in assay signal.

- 224 **nonspecific adsorption/binding**

Undesirable phenomenon of the chemical adsorption of analytes to the interior surfaces of the vessels. Typically addressed by the use of a solvent composition within which the given **analyte** has increased or free solubility at the appropriate concentrations, the use of vessels of different material or surface chemistry, or the addition of compounds that block or compete for the binding of the **analyte** to the surface.

- 225 **nontargeted analysis**

Analysis of the composition of a complex sample without applying pre-defined selection criteria, with the aim to identify previously **unknown** sample components. The opposite of selective (targeted) analysis in which specific data are generated.

- 226 **normal-phase chromatography**

A type of chromatography employing a polar **stationary phase** and a non-polar **mobile phase**. Hydrophobic analytes have limited affinity for the stationary phase and are eluted first, while hydrophilic analytes tend to adsorb to the stationary phase and are eluted by increasing the polarity of the mobile phase.

- 227 **nuclear magnetic resonance (NMR) spectroscopy**

Analytical technique that exploits the magnetic properties of some atomic nuclei to determine the physical and chemical properties of the atoms or molecules that contain them. Can provide highly detailed structural information and can be used both quantitatively and qualitatively.

- 228 **online extraction**

A bioanalytical methodology that integrates sample extraction, typically in the solid-phase extraction format, and chromatography after injecting biological **samples** such as **plasma** with no or minimal pretreatment.

- 229 **optimization**

The process of varying the conditions of an analytical **method** to determine the optimal **method** conditions.

- 230 **oral administration**

Route of administration where a substance is taken through the mouth. This includes buccal, sublingual and prelingual administration routes.

- 231 **Organisation for Economic Cooperation and Development (OECD)**

An international economic organization of 34 countries founded in 1961 to stimulate economic progress and world trade. It has issued a set of **good laboratory practice (GLP)** guidelines that are followed in multiple (e.g., European) countries.

- 232 **orthogonal**

Within a quantitative **method**, refers to at least two separation modes that demonstrate different selectivities, the optimized combination of which is favorable. The separation modes can be extractive, chromatographic or mass spectrometric.

- 233 **out of specification (OOS) investigation**

An initial laboratory finding that is outside of predefined limits requires a documented investigation of the cause, assessment of the potential impact, corrective action and preventive action.

- 234 **outlier**

A result that differs unreasonably from the others in a set of data, and is therefore a suspect measurement. Outliers may be verified as such using statistical methods.

- 235 **over-curve concentration**

A sample with concentration above the validated range of the analytical **method** (> **upper limit of quantitation [ULOQ]**).

- 236 **parallelism**

A condition in which **dilution** of test **samples** does not result in biased measurements of the **analyte** concentration. Determined for immunoassays by comparison of the responses from the **calibration standard** curve and serially diluted study samples in order to detect possible **matrix effect** or differing affinities for metabolites.

# WHY RISK IT?

**Clinical Bioanalysis Services from Charles River.** Timing is critical to the success of clinical trials. With Charles River as a partner, you can front-load clinical timelines as early as the preclinical phase. Our scientists gain expertise in your molecule's behavior, become familiar with long-term study goals and prepare to validate and perform the assays on clinical samples, so we are ready whenever you say go. **Why risk it?** Connect with us today at [www.criver.com/clinicalsupport](http://www.criver.com/clinicalsupport).

[www.criver.com](http://www.criver.com)

  
charles river

- 237 **parallel-line analysis (PLA)**

A statistical **method** for the comparison of potency between a reference product and test product. It is used to calculate relative potency by comparing the dose–response curves of the two products.

- 238 **paratope**

The part of an antibody that recognizes an **antigen**.

- 239 **parent ion**

In mass spectrometry, an electrically charged molecular moiety that may dissociate to form fragments, one or more of which may be electrically charged, and one or more neutral species. Also called "**precursor ion**".

- 240 **partial least squares regression (PLS)**

Well-established regression-based **method** thanks to its ability to deal with many correlated variables or in situations where fewer observations than measured variables are available. PLS builds a low-dimensional sub-space by maximizing the covariance between the data and the class assignment. **Orthogonal** partial least squares analysis (O-PLS) and O2-PLS are recent extensions of the PLS **method** applied to metabolomic data.

- 241 **partial validation**

Series of analytical experiments where only relevant parts of the validation are repeated after **method** modifications or transfer are made to an existing fully validated bioanalytical method.

- 242 **peak area**

The area of the peak on a **chromatogram** produced by a substance subjected to chromatographic analysis. Proportional to the concentration of the substance.

- 243 **peak area ratio**

Ratio of the instrument response **peak area** of the target compound in the sample or sample extract to the peak area of the **internal standard**.

- 244 **peak capacity**

Chromatographic selectivity demonstrated by showing the maximal numbers of peaks that can be **baseline** resolved in a given chromatographic time window.

- 245 **peak height**

The instrument response height of the peak on a **chromatogram** produced by a substance subjected to chromatographic analysis. Proportional to the concentration of the substance.

- 246 **peak height ratio**

Ratio of the instrument response **peak height** of the target compound in the sample or sample extract to the peak height of the **internal standard**.

- 247 **peak tailing**

Distortion of the form of a chromatographic peak, which deviates from its theoretical Gaussian form due to one or more factors, including secondary interactions of the **analyte** with separation materials.

- 248 **peak tailing factor**

Also known as 'symmetry factor'; a chromatographic term that shows the asymmetry of a chromatographic peak.

- 249 **peripheral compartment**

The sum of all body regions to which a drug eventually distributes, but are less perfused and therefore are not in instantaneous equilibrium with the concentration in blood or **plasma**.

- 250 **pharmacodynamics (PD)**

The relationship between drug concentration at the site of action (receptor) and pharmacologic response, including biochemical and physiologic effects that influence the interaction of drug with the receptor.

- 251 **pharmacokinetics (PK)**

The kinetics of drug **absorption** distribution, and elimination (i.e., excretion and metabolism).

- 252 **pharmacometabonomics/pharmacometabolomics**

Analysis of endogenous metabolites in bodily fluids used to predict or evaluate the metabolism of pharmaceutical drugs, and to understand the pharmacokinetic profile of a drug. Alternatively, it is applied to measure **metabolite** levels following the administration of a pharmaceutical drug, in order to monitor the effects of the compound on certain biochemical pathways.

- 253 **phospholipids**

A class of lipids that are the major components of cell membrane bilayers. In **bioanalysis**, these have been identified as one of the major endogenous components that can cause **matrix effects**.

- 254 **pipette**

A manual or automated mechanical device that can accurately and repeatedly transfer liquid volumes of biological fluids, **stock solutions**, solvents, among others.

- 255 **placebo**

A substance containing no medication and prescribed or given to humans or animals in clinical or **preclinical trials** as a control treatment.

- 256 **plasma**

The pale yellow liquid component of blood that holds the blood cells in suspension.

- 257 **plasma protein binding**

The extent to which a drug binds to endogenous **plasma** proteins, often expressed as the fraction of the drug that is protein-bound (in percentage).

• 258 **point-of-care testing**

Also known as ‘bedside testing’; bioanalytical testing near or at the site of patient care.

• 259 **polymerase chain reaction (PCR)**

A molecular biological **method** used to enzymatically amplify a single or few copies of a particular DNA sequence using short DNA sequences called DNA primers.

• 260 **population-specific cut point**

A threshold level determined for and applied to a target population to define the presence or absence of a response.

• 261 **post-column infusion**

Technique for the evaluation of **matrix effect** profiles in LC-MS analysis, by injection of a solvent blank or **matrix** blank into the chromatography column while simultaneously infusing **analyte** by a syringe pump to the column effluent.

• 262 **post-translational modification (PTM)**

Chemical modification to polypeptides, such as the attachment of functional groups (phosphate, carbohydrates), during their biosynthesis after their translation from mRNA sequence.

## NOW INTRODUCING GC-MS/MS BIOANALYSIS

The addition of a ThermoScientific Quantum XLS Ultra GC-MS/MS allows Alturas Analytics to expand the variety of bioanalytical services we provide.

### BIOANALYTICAL SERVICES

---

- ▶ GLP and Non-GLP Bioanalysis
- ▶ Method Development and Validation
- ▶ Biomarker Quantitation
- ▶ Dose Solution Analysis
- ▶ Protein Binding Estimations

### QUALITY SYSTEMS

---

- ▶ Compliant to GLP and FDA, EMA and Crystal City Guidelines

### LC-MS/MS INSTRUMENTATION

---

- ▶ AB Sciex 4000, 5000, 5500 and 6500 systems

### ABOUT ALTURAS ANALYTICS, INC.

Founded in 2000, Alturas Analytics is a privately owned contract research organization (CRO) focused on LC-MS/MS and GC-MS/MS bioanalytical services.

1324 Alturas Drive | Moscow, ID 83843  
208.883.3400 | [www.alturasanalytics.com](http://www.alturasanalytics.com)

- 263 **precision**

The closeness of agreement (i.e., degree of scatter) among a series of measurements obtained from the same homogenous sample under controlled assay conditions. Precision is defined as  $(\text{standard deviation}/\text{mean}) \times 100\%$ . Three levels can be distinguished:

- **Repeatability**;
- Intermediate precision;
- **Reproducibility**.

- 264 **preclinical trial**

A study to test a drug, procedure, or medical treatment in animals.

- 265 **precursor ion**

See “**parent ion**”.

- 266 **predictive metabolomics**

Prediction of quantitative functional value of a treatment by means of multivariate analysis using metabolome data (**metabolite** signatures) as the explanatory variable.

- 267 **predose sample**

Biological sample, typically **plasma**, that is taken from the test subjects prior to receiving the study drug(s).

- 268 **preventative maintenance (PM)**

Scheduled equipment maintenance in bioanalytical laboratories.

- 269 **principal components analysis (PCA)**

A statistical procedure using an **orthogonal** transformation of multivariate data, mostly used for exploratory analyses by extracting and displaying systematic variations. The vast majority of metabolomic studies involve PCA as a first exploratory step.

PUSHING THE LIMITS IN MASS SPECTROMETRY

# AB SCIEX SelexION™ Technology

A NEW DIMENSION IN SELECTIVITY

## **Ion mobility spectrometry for quantitative and qualitative applications**

SelexION™ technology on the AB SCIEX Triple Quad™ 5500 and QTRAP® 5500 systems delivers a new dimension of selectivity and performance for any application requiring the separation of isobaric species, isolation of challenging co-eluting contaminants and reduction of high background noise.

Explore a new dimension at [www.absciex.com/pharma-ss](http://www.absciex.com/pharma-ss)

**AB SCIEX**

- 270 **Principal Investigator**

An individual who, for a **multi-site study**, acts on behalf of the **Study Director** and has defined responsibility for delegated phases of the study. The Study Director's responsibility for the overall conduct of the study cannot be delegated to the Principal Investigator(s); this includes approval of the **study plan** and its amendments, approval of the final report, and ensuring that all applicable principles of **good laboratory practice (GLP)** are followed.

- 271 **processed sample**

The final extract (prior to instrumental analysis) of a sample that has been subjected to various manipulations (e.g., extraction, **dilution**, concentration).

- 272 **prodrug**

A substance designed to be rapidly converted to its active ingredient in the body after administration. A prodrug is typically synthesized to enhance the systemic **absorption** of the active drug.

- 273 **product ion**

The ion resulting from the fragmentation of a charged molecular species in a mass spectrometer. Also known as a "**daughter ion**".

- 274 **protein binding**

The binding of compounds, with typical reference to xenobiotics, to large **plasma** proteins such as albumin. The extent of protein binding of a drug varies according to the chemistry of the drug itself and certain disease states, and only the unbound fraction is considered to be freely able to move into tissues or have activity with cellular surface receptors.

- 275 **protein precipitation**

A process for removing proteins from sample matrices involving aggregation and precipitation of proteins by adding a precipitation solvent or reagent, often using organic solvent or strongly acidic solution.

ANNUAL

# BOSCA

The Bioanalysis Outstanding Contribution Award, run annually by *Bioanalysis* and Bioanalysis Zone, recognizes top scientists for their research and the vital contributions they have made to the bioanalytical community.

[d.murray@future-science.com](mailto:d.murray@future-science.com)

You nominate  
your bioanalytical  
heroes and our  
judging panel  
selects a winner!

- 276 **protocol**

A document that describes the objective(s), design, methodology, statistical considerations, and organization of a trial or a study. The protocol usually also gives the background and rationale for the trial, but these could be provided in other protocol referenced documents.

- 277 **protocol amendment**

Documentation of an intended change to the **study plan** after the study initiation date.

- 278 **protocol deviation**

Documentation of an unintended departure from the **study plan** after the study initiation date.

- 279 **proxy matrix**

A suitable **matrix** that can be used in place of an original matrix available in limited amounts.

- 280 **qualified assay**

Assay that is not validated, but is deemed suitable (scientifically sound) in performance for the purpose of the studies it is used to support. See also “**scientific validated assay**”.

- 281 **quality assurance**

All those planned and systematic actions that are established to ensure that the trial is performed and the data are generated, documented (recorded), and reported in **compliance** with the applicable regulatory requirement(s). May also refer to the independent quality unit required within **good laboratory practices (GLPs)** for quality oversight.

- 282 **quality control**

Activities undertaken within the quality management system to verify that operational activities and derived data have been verified.

- 283 **quality control sample (QC)**

A sample spiked with a known quantity of **analyte** in the same **matrix** as the **unknown samples** that is used to monitor the performance of a bioanalytical **method** and to assess the integrity and validity of the results of the unknown samples analyzed in an individual run.

- 284 **quantification range**

The range of concentrations, including ULOQ and LLOQ, that can be reliably and reproducibly quantified with **accuracy** and **precision** through the use of a concentration–response relationship.

- 285 **radioimmunoassay (RIA)**

A sensitive, competitive, **immunoassay** technique whereby a limited amount of radiolabeled **antigen** competes with unlabeled antigen for binding to a limited amount of specific antibody. Competition with increasing amounts of unlabeled antigen provides a **calibration curve** from which concentrations of antigen in study **samples** may be interpolated.

- 286 **raw data**

Per the **Organisation for Economic Cooperation and Development (OECD) good laboratory practice (GLP)** regulations, all original test facility records and documentation, or verified copies thereof, which are the result of the original observations and activities in a study. According to the **US FDA**, any laboratory worksheets, records, memoranda, notes, or exact copies thereof, that are the result of original observations and activities of a nonclinical laboratory study and are necessary for the reconstruction and evaluation of the report of that study. In the event that exact transcripts of raw data have been prepared (e.g., tapes that have been transcribed verbatim, dated and verified accurate by signature), the exact copy or exact transcript may be substituted for the original source as raw data.

- 287 **reactive metabolite**

Drugs are generally converted to biologically inactive forms and eliminated from the body, principally by hepatic metabolism. However, certain drugs undergo biotransformation to reactive metabolites that can interfere with cellular functions. These are often electrophilic and can interact with DNA and proteins to form covalently bound products.

- 288 **reanalysis**

Repetition of a series of analytical procedures from the processing step on **samples** that have been previously analyzed.

- 289 **recovery (extraction)**

The extraction efficiency of an analytical process, reported as a percentage of the known amount of an **analyte** carried through the sample extraction and processing steps of the **method**.

- 290 **reference standard**

A substance well-characterized for its chemical and physical properties, accompanied with a **certificate of analysis (CoA)** that provides the purity and expiration (or retest) date.

- 291 **regulated bioanalysis**

**Bioanalysis** conducted in **compliance** with regulatory requirements (e.g., **US FDA**, **EMA**, ANVISA, MHLW).

- 292 **regulatory validation**

The conduct and reporting of experimental testing of a **method** to demonstrate that the concentration data are scientifically accurate, reproducible and reconstructable to allow valid decision-making for the intended purpose of the study, and comply with regulated bioanalytical standards as defined in guidance and guidelines.

Sponsored by

- 293 **relative bioavailability**

The **bioavailability** of a formulation of a drug compared with that of an alternative formulation.

TOGETHER. IT'S HOW WE WORK. IT'S HOW WE SUCCEED.

# DO MORE TOGETHER

WITH OPEN ACCESS SOLUTIONS

Spend less time managing and more time analyzing. Agilent open access solutions accelerate discovery by simplifying the management of multiple LC/MS and NMR instruments.

With MassHunter Walkup Software, analytical chemists can easily configure and maintain multiple mass spec instruments right from their desks. VnmrJ 4 Persona Manager provides NMR facility managers with the best, most flexible platform for managing multiple users and spectrometers.

The Measure of Confidence

**LEARN MORE** — access webinars and case studies at  
[agilent.com/chem/togetheropenaccess](http://agilent.com/chem/togetheropenaccess).

- 294 **relative standard deviation (RSD)**

See “**coefficient of variation**”.

- 295 **repeatability**

Repeatability expresses the **precision** under the same operating conditions over a short interval of time. Repeatability is also synonymous with **intraassay precision**.

- 296 **reproducibility**

Reproducibility expresses the **precision** between multiple measurements of a sample or sample sets, which may include those between laboratories (collaborative studies, usually applied to standardization of methodology).

- 297 **resolution**

The extent of separation of two or more compounds using a given technique, such as chromatography or mass spectrometry.

Sponsored by

**Agilent Technologies**

- 298 **response function**

A mathematical treatment that adequately describes the relationship between instrument response (e.g., **peak area** or height ratio) and the concentration (amount) of **analyte** in the sample. Response function is defined within a given range.

- 299 **retention time (RT)**

Refers to the specific time needed by the **analyte** to be detected after its injection into a separative process (e.g., a **chromatographic column**).

- 300 **reversed-phase chromatography**

Type of chromatography employing a nonpolar **stationary phase** and a polar **mobile phase**. Hydrophilic analytes have limited affinity for the stationary phase and are eluted first, while hydrophobic analytes tend to adsorb to the stationary phase and are eluted by decreasing the polarity of the mobile phase.

- 301 **risk-based approach**

Has multiple meanings in drug development, all relating to the evaluation of the risk of failure versus the resource investment required to maintain the required quality level. The regulatory guidance and **white papers** by health authority authors support a risk-based approach for companies designing their own tiered testing schemes (i.e., **fit-for-purpose** bioanalytical strategy). This is also used in terms of a **tiered approach** for **metabolite** analyses and in consideration of **biomarker** analyses.

- 302 **r-squared**

A term, often referred to as the correlation coefficient, used to assess the fitness of a linear relationship when performing regression.

- 303 **signal-to-noise ratio (S/N)**

The ratio of actual response signal to the differentiated background signal for a given detector.

- 304 **salting out assisted liquid–liquid extraction (SALLE)**

The process by which a solution is supersaturated with salt to cause the formation of a biphasic system between a water sample and a water miscible sample.

- 305 **sample**

A generic term encompassing calibrators, controls, blanks, unknowns and **processed samples**.

- 306 **sample diluent**

Aqueous or organic fluids used to dilute the **analyte** prior to the analytical process (e.g., chromatographic separation, **derivatization**, binding to a receptor or antibody).

Sponsored by  **Agilent Technologies**

- 307 **sample pretreatment**

A process whereby fluid or tissue **samples** are homogenized, lysed, digested, sonicated, pulverized or extracted prior to analysis.

- 308 **scientific validation**

To provide concentration data that are scientifically accurate, reproducible and reconstructable to allow valid decision-making for the intended purpose of the study and that can withstand independent review (and, although not following regulated guideline “**standard operating procedure (SOP)**”, also review from regulators if so required). Within scientific validation, the following tiers can be defined: “**stage-appropriate scientific validation**” or “**assay-appropriate scientific validation**”.

- 309 **selected reaction monitoring (SRM)**

The most selective tandem quadrupole operating mode and ideal for quantitative applications. **Precursor ions** are isolated then collision-activated dissociation of the precursor occurs, with **product ion** isolation completing the process.

- 310 **selectivity**

The ability of the bioanalytical **method** to measure and differentiate the analytes in the presence of components that may be expected to be present. These could include metabolites, impurities, degradants or **matrix** components.

Sponsored by

- 311 **sensitivity**

The lowest **analyte** concentration that can be measured above the noise with acceptable **accuracy** and **precision** (i.e., **lower limit of quantification [LLOQ]**).

Sponsored by

# Bioanalysis

Young investigator  
AWARD

Highlighting the most  
promising young  
investigators in bioanalysis!

Each year, *Bioanalysis* and  
*Bioanalysis Zone* run the Young  
Investigator Award, in association with  
Waters and the European Bioanalysis  
Forum, to find and reward young  
investigators already making their  
mark in the field of bioanalysis.

Sponsored by:

**Waters**  
THE SCIENCE OF  
WHAT'S POSSIBLE.®

- 312 **serum**

The liquid that is obtained after clotting of the blood and subsequent **centrifugation**.

- 313 **shotgun proteomics**

Identification of proteins in the sample is based on a preliminary enzymatic **digestion** of the mixture followed by **HPLC–MS/MS** characterization of the resulting peptides.

- 314 **significant human metabolite**

A **metabolite** seen in humans that is either greater than 10% of all drug-related material in circulation or a metabolite whose exposure in humans is greater than that seen in animal species. A significant human metabolite typically requires additional monitoring or studies to demonstrate its safety.

- 315 **single-dose administration**

The next dose of the same drug is administered only after the drug of the previous dose is completely eliminated from the body.

- 316 **size-exclusion chromatography**

Chromatographic separation based on the relative sizes of the analytes.

- 317 **solid-phase extraction (SPE)**

A sample preparation procedure using packed solid sorbent and defined **protocol** of conditioning, equilibration, **sample pretreatment**, loading and **elution** to provide a separation of analytes from other biological components.

- 318 **solubility**

The propensity for an **analyte** to dissolve in a liquid forming a homogeneous solution, dependent on the physical and chemical properties of the solute and solvent.

- 319 **specificity**

The ability to measure the **analyte** unequivocally in the presence of other compounds, either exogenous or endogenous, in the **matrix**.

- 320 **specimen**

A specifically selected proportion of a material taken from a dynamic system and assumed to be representative of the parent material at the time it is taken. See also “**sample**”.

- 321 **spike recovery**

The amount of **analyte** that is measured upon analysis of a sample (e.g., **matrix**) to which a known amount of analyte has been added. See also “**recovery**”.

- 322 **stability**

The chemical stability of an **analyte** in a given **matrix** under specific conditions for given time intervals.

- 323 **stable-labeled isotope**

**Analyte** in which a few atoms are exchanged with heavy isotope counterparts, typically  $^2\text{H}$ ,  $^{15}\text{N}$  or  $^{13}\text{C}$ . It is commonly used as an **internal standard** in LC–MS **bioanalysis** as it has very similar physical and chemical properties as the analyte and works well to compensate for the variability due to extraction, chromatography and mass spectrometry (MS) detection.

- 324 **stage-appropriate scientific validation**

One process of scientific validation, where, depending on the stage of development in which the study is supported, the proposed assay criteria for scientific validation may be different. In all stages, however, the reported concentrations support valid and documented decisions in the study. When a compound progresses in development, the study could change from nonpivotal (internal decision) into pivotal. **Regulatory validation** can be considered as the ultimate level of stage appropriate scientific validation.

- 325 **standard curve**

The relationship between the experimental response values and the analytical concentrations of the calibrants (also called “**calibration curve**”). Is also used for the physical **samples** used to generate the experimental responses.

- 326 **standard operating procedure (SOP)**

Document that describes the recurring operations relevant to the quality of an activity that enables proper, consistent execution of the operations by someone knowledgeable in the field.

- 327 **stationary phase**

In chromatographic methods of analysis, typically, a solid material (typically modified silica or polymeric material) usually contained in a column, through which a **mobile phase** is moving. Separation of a mixture of analytes is achieved by differences in partitioning, adsorptive, electrostatic or affinity-type interactions between the mobile and stationary phases.

- 328 **steady state**

The level of the drug in blood and tissue upon multiple dosing when input and output are at equilibrium during sequential dosing intervals.

- 329 **stock solution**

Solution containing **analyte** of interest at a known concentration that can be further diluted to prepare calibration standards and **quality control samples (QCs)** in biological fluids.

- 330 **Study Director**

Has overall responsibility for the technical conduct of the study, as well as for the interpretation, analysis, documentation and reporting of results, and represents the single point of study control.

NOW YOU CAN START THINKING OF

**MICROSCALE SENSITIVITY**

**IN TERMS OF**

**POSSIBILITIES,**

**NOT RESTRAINTS.**

Introducing Waters<sup>®</sup> ionKey/MS<sup>™</sup> System. Open the door to the new world of robust, reliable and reproducible microscale with dramatically enhanced sensitivity and significantly lower solvent consumption compared to 2.1 mm ID chromatography. This plug & play MS system gives your whole lab access to UPLC<sup>®</sup> chromatography performance and highly sensitive, reliable data. This is where the industry's going. You can get there today. - 331 **Study Monitor**

Responsible for overseeing the progress of a clinical study, and for ensuring that it is conducted, recorded, and reported in accordance with the **protocol**, **standard operating procedure (SOP)**, **good clinical practice (GCP)** and applicable regulatory requirement(s).

- 332 **study plan**

A document to describe the purpose and procedure of an experiment or a study. A study plan may supersede **standard operating procedure (SOP)** requirements.

- 333 **supercritical fluid chromatography (SFC)**

Also known as "convergence chromatography", a chromatographic technique that employs a supercritical fluid as the **mobile phase**.

- 334 **superficially porous (core-shell) particle technology**

In LC columns, the use of particles that have a nonporous core but fully porous outer layer.

- 335 **supernatant**

The liquid layer resting above a lower layer or solid residue, such as after **centrifugation** following **protein precipitation** from **plasma**.

- 336 **supported-liquid extraction**

Sample extraction technique fundamentally analogous to **liquid-liquid extraction** but with a different **protocol** that involves sample application to a solid support, composed of diatomaceous earth, and from which the analytes are subsequently eluted with water-immiscible organic solvent.

- 337 **surface plasmon resonance (SPR)**

Change of the reflective index of light reflected off a metallic film resulting from biomolecular binding on the opposite side of the film.

- 338 **surrogate analyte**

A compound similar to the **analyte** of interest used to evaluate extraction efficiency and **matrix effects** (e.g., stable-labeled isotope analogs).

- 339 **surrogate matrix**

Alternative **matrix** used in **bioanalysis** in place of an endogenous matrix that is difficult to sample, recreate or maintain.

- 340 **system priming**

Injection of extracted biological **samples** into a **HPLC** system prior to the run under the chromatographic condition for the **analytical run**. System priming is mainly for blocking active sites that may adversely adsorb the analytes of interest. It should not be confused with **system suitability**.

- 341 **system suitability**

Determination of instrument performance (e.g., **sensitivity** and chromatographic retention) by analysis of a specific **samples** conducted prior to the **analytical run**.

- 342 **tandem mass spectrometry**

See “**tandem quadrupole mass spectrometry**”.

- 343 **tandem quadrupole mass spectrometry**

A quantitative tandem mass spectrometer consists of two quadrupole mass spectrometers in series, with a (non-mass-resolving) radio frequency (RF)-only quadrupole between them to act as a cell for collision-induced dissociation. The first (Q1) and third (Q3) quadrupoles serve as mass filters. **Precursor ions** selected in Q1 are dissociated in the collision cell in the presence of an inert gas such as Ar, He or N<sub>2</sub>. Resulting fragments are passed through to Q3 where they may be filtered or scanned. This configuration is sometimes referred to as a triple quad mass spec and is often abbreviated QqQ.

THE SCIENCE OF  
WHAT'S POSSIBLE.®

PUSHING THE LIMITS IN SENSITIVITY

Exceedingly sensitive.  
Sharply focused.

THE 6500 SERIES WITH IONDRIVE™ TECHNOLOGY

See what couldn't be seen. Until now. The new AB SCIEX 6500 LC/MS/MS series with multi-component IonDrive™ technology is the world's most sensitive triple quadrupole, improving sensitivity up to 10X and detector dynamic range by 20X over the best selling high performance triple quad – with no compromise in mass range.

Unique QTRAP® linear ion trap technology and optional SelexION™ differential ion mobility technology help enhance data quality and improve throughput while reducing the need for sample preparation. When merged with the Eksigent ekspert™ microLC 200 system, the functionally stackable design reduces lab space by 100%, while minimizing maintenance costs and reducing mobile phase costs by up to 95%.

The new AB SCIEX 6500 Series. It's the farsighted successor to a long line of leading AB SCIEX mass spec systems.

Explore visionary sensitivity at

**AB SCIEX**

- 344 **targeted analysis**

Analysis of the composition of a complex sample by applying predefined selection criteria with the aim to quantify or verify the occurrence of previously identified sample components.

- 345 **therapeutic drug monitoring**

Clinical monitoring of patient drug concentrations in **plasma**, serum or blood in order to enhance treatment efficacy, or reduce toxicity. Typically used to treat patients taking marketed drugs.

- 346 **tiered approach**

A science-driven, **fit-for-purpose** strategy for scientific validation applying a predefined appropriate level of bioanalytical quality, for the analysis of biological samples originating from preclinical and clinical studies. Level of pre- or in-study validation, **acceptance criteria** and documentation depend on the intended use of the concentration data, and consider the type of study (**assay-appropriate scientific validation**), and/or the stage of drug development (stage-appropriate scientific validation and **regulatory validation**) in which the study data are generated.

- 347 **time-of-flight mass spectrometry (TOF-MS)**

Mass analyzer that utilizes a field-free vacuum chamber to separate ions by their velocity. The time-of-flight is then converted into the **accurate mass** of the observed ion.

Sponsored by

**Waters**  
THE SCIENCE OF  
WHAT'S POSSIBLE.®

- 348 **tissue distribution**

The extent of accumulation of a therapeutic agent or chemical substance in various organs.

- 349 **total drug**

The sum of the bound and **free drug** within a biological system.

- 350 **total ion chromatogram (TIC)**

A **chromatogram** showing the sum of intensities of all mass spectral peaks belonging to the same scan.

- 351 **Ultra-high-performance liquid chromatography (UHPLC)**

Makes use of support particles that often have diameters less than 2  $\mu\text{m}$  in size. These smaller particles make it possible to obtain more efficient separations but also increase the pressure that is required to apply the **mobile phase** through a given length of column.

Sponsored by

**Agilent Technologies**

- 352 **unknown**

A biological sample that is the subject of the analysis with the goal to determine **analyte(s)** concentrations.

- 353 **upper limit of quantification (ULOQ)**

The highest concentration **calibration standard** of an **analyte** that can be quantitatively determined with **precision** and **accuracy**, and represents the concentration above which **incurred samples** must be diluted to achieve a response less than this concentration.

- 354 **US Food and Drug Administration (US FDA)**

An agency within the US Public Health Service that is responsible for approving the safety and efficacy and marketability of medicines, among other health-related services.

- 355 **validation report**

A summary of the experimental (assay **method**) validation findings that define the performance characteristics of the method for its intended use. It describes the statistical acceptance of the method.

- 356 **van Deemter equation**

$H = A + B/u + C_u$ ; the A term represents the contribution from eddy diffusion. Eddy diffusion results from radial flow inequalities through a packed bed. The B term ( $B/u$ ) represents the contribution from longitudinal diffusion. The C term ( $C_u$ ) represents the contributions from resistance to mass transfer in the **stationary and mobile phases**.  $u$  is mobile phase velocity (mm/s). An optimum mobile phase velocity exists for a column at which its highest efficiency would be realized. While the A term is somewhat fixed for each column, the B and C terms play a significant role in the column efficiency.

- 357 **Very-high-pressure liquid chromatography (VHPLC)**

See “**UHPLC**”.

- 358 **weighting factor**

Weighted least-squares **linear regression** is justified in the commonplace scenario of the statistical **error** or variability of instrumental response being approximately proportional to **analyte** concentration. A weighting factor such as  $1/x$  or  $1/x^2$ , where  $x$  denotes concentration, is chosen in accordance with the severity of weighting required.

- 359 **white paper**

Authoritative report or guide helping readers understand an issue, solve a problem, or make a decision. Typically written by a panel of subject matter experts to ensure a broad consensus.

- 360 **whole blood**

Unmodified or unseparated blood sample. May be drawn from arteries or veins.

## AB SCIEX

AB SCIEX is a global leader in the US\$2 billion mass spectrometry market. Mass spectrometry solutions enable laboratories to analyze a wide variety of contaminants, compounds and proteins in order to obtain answers to some of most important issues facing humanity today.

- Protecting the global food supply
- Making medicine more effective and drug discovery lower cost
- Better understanding of diseases
- Improving clinical care
- Identifying environmental contamination
- Solving drug-related crimes

**TRUST** – The company's global leadership and world-class service and support have made it a trusted partner to thousands of scientists and laboratory analysts around the world.

**LEADERSHIP** – AB SCIEX excels by listening to and understanding the ever-evolving needs of its customers to develop reliable, sensitive and intuitive solutions that continue to redefine what is achievable in routine and complex analysis.

**INNOVATION** – AB SCIEX helps to improve the world we live in by enabling scientists and laboratory analysts to push the limits in their field and address the complex analytical challenges advancing biological studies, chemical analysis and contaminant surveillance.

**QUALITY OF LIFE** – The impact of AB SCIEX innovation is experienced every day, whether through safer food, cleaner drinking water, more effective drugs, or safer neighborhoods.

# Thermo

## SCIENTIFIC

A Thermo Fisher Scientific Brand

### THERMO SCIENTIFIC

Thermo Fisher Scientific is the world leader in serving science. Our mission is to enable our customers to make the world healthier, cleaner and safer. We help our customers accelerate life sciences research, solve complex analytical challenges, improve patient diagnostics and increase laboratory productivity. Through our four premier brands – Thermo Scientific, Life Technologies, Fisher Scientific and Unity Lab Services – we offer an unmatched combination of innovative technologies, purchasing convenience and comprehensive support.

## THE SCIENCE OF WHAT'S POSSIBLE.®

### WATERS

Waters Corporation, the premium brand in the analytical instruments industry, creates business advantages for laboratory-dependent organizations by delivering practical and sustainable scientific innovation. Waters helps customers make profound discoveries, optimize laboratory operations, deliver product performance, and ensure regulatory compliance by providing a connected portfolio of separations and analytical science, laboratory informatics, mass spectrometry, as well as thermal analysis.

Waters drives decision-making and improves laboratory effectiveness within the pharmaceutical, health sciences, food and beverage, environmental, agriculture, and chemical materials industries by providing the tools to improve the quality of today's science and explore the infinite possibilities of tomorrow's.

## ABS LABORATORIES

Whatever stage of drug discovery or development you are working in ABS Laboratories is the CRO for you. This MHRA GLP and GCP accredited laboratory can meet all your requirements for quantifying drugs, their metabolites and biomarkers in a range of biological fluids. Our staff have over 100 years experience in this arena. We can support large and small studies using LC-MS/MS, GC-MS and multiplexed immunoassay using chemiluminescence on the MSD platform. We can develop and validate assays that are 'Fit for Purpose' for your particular stage of drug discovery or development and provide quick turnaround time for results.

## ALTURAS ANALYTICS, INC.

Alturas Analytics operates as a CRO supporting pharmaceutical research and development, proving itself as a leader in antibody–drug conjugate and biomarker analysis. It specializes in regulated LC-MS/MS and GC-MS/MS and is experienced in small- and large-molecule analysis. Alturas Analytics services include: bioanalytical method development and validation, routine quantitative analysis of preclinical and clinical samples from GLP and non-GLP studies. Alturas Analytics is proud to be privately owned and sponsor funded since 2000.

## Agilent Technologies

### AGILENT TECHNOLOGIES

Agilent Technologies Inc. is the world's premier measurement company and a technology leader in chemical analysis and life sciences. The company's 20,600 employees serve customers in more than 100 countries.

Agilent partners with pharmaceutical companies to develop solutions that help accelerate drug discovery, improve productivity and confidence in drug development and ensure reliable manufacturing quality control. Agilent has easy-to-use, end-to-end and robust solutions including sample preparation automation, premium U/HPLC systems, reliable, high performance LC/MS, and leading-edge columns and supplies to optimize chromatographic results.

Agilent solutions offer unparalleled throughput, efficiency and innovation to early ADME studies. Agilent also provides robust, reliable data and complete workflow solutions for PK studies.

### ALGORITHMME PHARMA

Founded in 1992, Algorithme Pharma is an established early stage clinical CRO providing multiple research services for pharmaceutical, biotechnology and generic drug industries.

With over 20 years of experience in clinical research, the organization successfully completes over 200 clinical trials annually in Phase I/IIa and Bioequivalence and is comprised of almost 500 professionals from the medical and scientific fields.

Facilities include a seven-unit clinic with 265 beds and a 20,000 square foot Bioanalytical laboratory, which performs large and small molecule bioanalysis on samples from preclinical to Phase IV studies.

LGC

Through the acquisition of the leading bioanalytical business from Quotient Bioresearch in December 2012, LGC has a world-class bioanalytical capability with more than 50 years' experience in high-integrity analytical science and expertise spanning small and large molecules, biomarkers, molecular biology and microbiology.

Operating from state-of-the-art facilities to GLP, GCP and cGMP standards, LGC also has leading capabilities in CMC, with particular specialties in materials science and pharmaceutical analysis.

With a dedicated team of scientists focused on providing laboratory services to help accelerate the development of new medicines, we work on behalf of clients all over the world and our consultative, science-driven approach ensures the highest quality data to support new product development and manufacture.

Our flexible and tailored services follow the same rigorous principles for all experimental work, so whether you require nonregulated discovery or full regulatory studies, you know that your samples are in safe hands.

## CHARLES RIVER

Charles River provides laboratory services to support our clients as they move from discovery through clinical development. We can develop, validate and apply quantitative bioanalytical methods for the pharmaceutical, biotechnology, medical device and chemical industries. Our laboratories have the latest instrumentation to measure drug and metabolite concentrations in biological matrices using a wide range of techniques and technology platforms for small and large molecules. We have the capacity to support you with rapid lead-in times in order to meet critical deadlines. Our scientists utilize fully validated, networked data management systems at all laboratory locations for test article/item and sample management.

## SIGMA-ALDRICH

Sigma-Aldrich is a leading Life Science and High Technology company whose analytical, biochemical, organic chemical products, kits and services are used in scientific research, including genomic and proteomic research, biotechnology, pharmaceutical development, the diagnosis of disease and as key components in pharmaceutical, diagnostics and high technology manufacturing. Sigma-Aldrich customers include more than 1.3 million scientists and technologists in life science companies, university and government institutions, hospitals and industry. The company operates in 35 countries and has nearly 9000 employees whose objective is to provide excellent service worldwide. Sigma-Aldrich is committed to accelerating customer success through innovation and leadership in Life Science and High Technology.

# BIOANALYSIS AUTHOR GUIDELINES

## Audience

The audience for Future Science titles consists of clinicians, research scientists, decision-makers and a range of professionals in the healthcare community.

## Submission

We accept unsolicited manuscripts. If you are interested in submitting an article, or have any queries regarding article submission, please contact the Commissioning Editor directly ([k.crews@future-science.com](mailto:k.crews@future-science.com)). For new article proposals, the Editor will require a brief article outline and working title in the first instance. We also have an active commissioning program whereby the Editor, under the advice of the Editorial Advisory Panel, solicits articles directly for publication.

## Peer review & revision

Once the manuscript has been received in-house, it will be peer-reviewed (usually 4 weeks). Following peer review, 2 weeks is allowed for any revisions (suggested by the referees/Editor) to be made.

## In-house production

Following acceptance of the revised manuscript, it will undergo production in-house. Authors will receive proofs of the article to approve before going to print, and will be asked to sign a copyright transfer form (except in cases where this is not possible, i.e., government employees in some countries).

## Article types

For a more detailed description of each article type, please view our author guidelines at: [www.future-science.com](http://www.future-science.com)

## Reviews

Reviews aim to highlight recent significant advances in research, ongoing challenges and unmet needs.

*Word limit: 4000–8000 words (excluding Abstract, Executive Summary, References and Figure/Table legends). Mini-reviews are also accepted.*

### Required sections

(for a more detailed description of these sections go to [www.future-science.com](http://www.future-science.com)):

- Abstract
- Defined key terms
- Future perspective
- Executive summary
- References: target of 150 maximum
- Reference annotations
- Financial disclosure/acknowledgements

## Research articles

*Word limit: 5000-7000*

### Required sections

(for a more detailed description of these sections go to [www.future-science.com](http://www.future-science.com)):

- Structured abstract
- Defined key terms
- Introduction
- Experimental
- Results and discussion

- Conclusions
- Executive summary
- Future perspective
- References
- Reference annotations
- Financial disclosure/acknowledgements

## Perspectives

*Word limit: 4000–8000*

Perspectives should be speculative and very forward looking, even visionary. They offer the author the opportunity to present criticism or address controversy. Authors of perspectives are encouraged to be highly opinionated. The intention is very much that these articles should represent a personal perspective. Referees will be briefed to review these articles for quality and relevance of argument only. They will not necessarily be expected to agree with the authors' sentiments.

## Special reports

*Word limit: 3000–5000*

Special reports are short review-style articles that summarize a particular niche area, be it a specific technique or therapeutic method.

## Editorials/opinions

*Word limit: 1000-1500*

Editorials are short articles on issues of topical importance. We encourage our editorial writers to express their opinions, giving the author the opportunity to present criticism or address controversy. The intention is very much that the article should offer a personal perspective on a topic of recent interest. Editorials should not contain figures or tables. Maximum 20 references. **Commentaries** (Word limit: 1500-3000) are also accepted.

## Conference reports

*Word limit: 1500–3000*

Conference reports aim to summarize the most important research presented at a recent relevant meeting or event. It is not usually feasible to attempt comprehensive coverage of the conference; authors should therefore focus on those presentations that are most topical, interesting or thought-provoking.

## Letters to the Editor

*Word limit: 1500*

Inclusion of Letters to the Editor in the journal is at the discretion of the Editor. All Letters to the Editor will be sent to the author of the original article, who will have 28 days to provide a response to be published alongside the letter.

## Bioanalytical challenge/regulatory focus

*Word limit: 1500–3000*

Bioanalytical Challenge articles are an excellent educational resource for the modern bioanalyst. An expert provides insights and solutions to specific laboratory issues. The articles are focused on the practical laboratory aspects, and authors are encouraged to describe failures as well as successes.

Regulatory Focus articles highlight regulatory issues of

importance to bioanalysts, and provide background information, issues and advice for implementing and following the regulations.

### Manuscript preparation

#### Spacing & headings

Please use double line spacing throughout the manuscript. No more than four levels of subheading should be used to divide the text and should be clearly designated.

#### Abbreviations

Full terms should be given on the first use only, with abbreviations used thereafter.

#### Spelling

US-preferred spelling will be used in the final publication.

#### Figures, tables & boxes

Future Science has a charge for the printing of color figures in the print issue of the journal. We have no page charges and aim to keep our color charge to a minimum. The charge does not apply to the online version of articles, where all figures appear in color at no charge.

#### Copyright

If a figure, table or box has been published previously (even if you were the author), acknowledge the original source and submit written permission from the copyright holder to reproduce the material where necessary.

As the author of your manuscript, you are responsible for obtaining permissions to use material owned by others. Since the permission-seeking process can be remarkably time-consuming, it is wise to begin writing for permission as soon as possible.

Please send us copies of letters or forms granting you permission for the use of copyrighted material so that we can see that any special requirements with regard to wording and placement of credits are fulfilled. Keep the originals for your files. If payment is required for use of the figure, this should be covered by the author.

#### Key formatting points

Please ensure your paper concurs with the following article format:

**Title:** concise, not more than 120 characters.

**Author(s) names & affiliations:** including full name, address, phone & fax numbers and e-mail.

**Abstract/Summary:** approximately 120 words. No references should be cited in the abstract.

**Keywords:** approximately 5–10 keywords for the review, including brief definitions.

**Body of the article:** content under relevant headings and subheadings.

**Conclusion:** analysis of the data presented in the review.

**Future perspective:** a speculative viewpoint on how the field will evolve in 5–10 years time.

**Executive summary:** bulleted summary points that illustrate the main topics or conclusions made under each of the main headings of the article.

#### References:

- Primary literature references, and any patents or websites, should be numerically listed in the reference section in the order that they occur in the text.
- Should appear as a number i.e., [1,2] in the text.
- Any references that are cited in figures/tables/boxes that do not appear in the text should also be numerically listed in the reference section in the order that they occur in the text.
- Quote first six authors' names. If there are more than six, then quote first three *et al.*

The Future Science Endnote style can be downloaded from our website at:

**[www.future-science.com/page/authors.jsp](http://www.future-science.com/page/authors.jsp)**

**Reference annotations:** please highlight 6–8 references that are of particular significance to the subject and provide a brief (1–2 line) synopsis. Papers should be highlighted as one of the following:

- of interest
- of considerable interest

**Figures/Tables/Boxes:** Summary figures/tables/boxes are very useful, and we encourage their use in reviews/perspectives/ special reports. The author should include illustrations and tables to condense and illustrate the information they wish to convey. Commentary that augments an article and could be viewed as 'stand-alone' should be included in a separate box. An example would be a summary of a particular trial or trial series, a case study summary or a series of terms explained. Please include scale bars where appropriate.

*If any of the figures or tables used in the manuscript requires permission from the original publisher, it is the author's responsibility to obtain this. Figures must be in an editable format.*

## BIOANALYSIS AIMS & SCOPE

*Bioanalysis* is a progressive discipline for which the future holds many exciting opportunities to further improve sensitivity, specificity, accuracy, efficiency, assay throughput, data quality, data handling and processing, analysis cost and environmental impact. Standards set by regulatory bodies regarding method development and validation increasingly define the boundaries between speed and quality. *Bioanalysis* encourages the submission of any forward looking applications, including biosensors, microfluidics, miniaturized analytical devices, and new hyphenated and multi-dimensional techniques.

In today's highly competitive global drug development arena, it is more important than ever that the modern bioanalytical laboratory is optimized for speed and success.

The content is uniquely targeted to those working on the analysis of drugs and metabolites in biological matrices. This is, primarily, bioanalysts working in pharmaceutical research and development, clinical laboratories, forensic toxicologists and sports doping analysts. The articles will also have wide appeal to analytical chemists, mass spectroscopists, chromatographers, pharmacologists, clinical chemists, analytical toxicologists, and those involved with studies of drug metabolism, pharmacokinetics, toxicity, bioequivalence and metabolomics.

*Bioanalysis* delivers essential information in concise, at-a-glance article formats. Key advances in the field are reported and analyzed by international experts, providing an authoritative but accessible forum for the modern bioanalyst. A regular *Bioanalytical Challenges* feature provides practical advice and troubleshooting to laboratory-based problems from world renowned experts.

*Bioanalysis* provides the busy bioanalyst with a forum for the rapid publication of original research and critical reviews of all the latest relevant and significant developments, including:

- Analyte extraction and sample preparation
- Biomarker assays
- Chromatography and separation sciences
- Data processing and statistics
- Diagnostic assays and test kits
- Drug and metabolite assays
- Innovative bioanalytical methods
- Laboratory automation and efficiency
- Ligand binding assays
- Mass spectrometry and other key detection methods
- Method development and validation reports
- New instrumentation and equipment
- Pharmacogenomics assays
- Regulatory and compliance issues

## ADVERTISING IN BIOANALYSIS

We offer a range of print and online advertising options with attractive introductory rates and package deals available. If you would like to know more about advertising in *Bioanalysis* or require a quotation, please contact Dionne Murray: [d.murray@future-science.com](mailto:d.murray@future-science.com)

## SUBSCRIPTION OPTIONS

### Institutional subscriptions

*Bioanalysis* is available in print, electronic or print and electronic formats, and pricing will depend on your organization type (academic, corporate, hospital, etc). Please contact [info@future-science.com](mailto:info@future-science.com) for more details.

Global e-access licenses are available on request and attract considerable discounts from standard site license fees. For further details on global access licenses, please contact [info@future-science.com](mailto:info@future-science.com)

### Consortia pricing

*Bioanalysis* welcomes discussion with all consortia, and offers flexible packages and discounted prices. If you have specific questions or would like a quote please contact [info@future-science.com](mailto:info@future-science.com) for more details.

### Personal subscriptions

Personal subscriptions are currently available to all Future Science journals. Payment must be made from a personal credit card registered to a home address. Print subscriptions will only be sent to a personal address. Please contact [info@future-science.com](mailto:info@future-science.com) for our personal order form.

**Print Subscription Rates 2015**

Article reprints are available through our reprint service. Please contact Sam Cavana: [s.cavana@future-science.com](mailto:s.cavana@future-science.com)

**Disclaimer:** Whilst every effort is made by the Publisher and Editorial Board to ensure that no inaccurate or misleading data, opinions or statements appear in this journal, they wish to make it clear that the data and opinions appearing herein are the responsibility of the contributor concerned. Accordingly, the Publisher, Editorial Board and their respective employees, officers and agents accept no liability whatsoever for the consequences of any inaccurate or misleading data, opinions or statements.

**Copyright:** Conditions of sale: *Bioanalysis* may be circulated only to those members of staff who are employed at the site at which the subscription is taken out. Readers are reminded that, under internationally agreed copyright legislation, photocopying of copyright materials is prohibited other than on a limited basis for personal use. Thus making copies of any article published in *Bioanalysis* is a breach of the law and can be prosecuted.

Future Science titles endorse the Uniform Requirements for Manuscripts Submitted to Biomedical Journals, issued by the International Committee for Medical Journal Editors, and Code of Conduct for Editors of Biomedical Journals, produced by the Committee on Publication Ethics.

This information is also available at [www.future-science.com](http://www.future-science.com)

### **Manuscript submission & processing**

Future Science titles publish a range of article types, including solicited and unsolicited reviews, perspectives and original research articles. Receipt of all manuscripts will be acknowledged within 1 week and authors will be notified as to whether the article is to progress to external review. Initial screening of articles by internal editorial staff will assess the topicality and importance of the subject, the clarity of presentation, and relevance to the audience of the journal in question. If you are interested in submitting an article, or have any queries regarding article submission, please contact the Managing Commissioning Editor for the journal (contact information can be found on our website at: [www.future-science.com](http://www.future-science.com)). For new article proposals, the Managing Commissioning Editor will require a brief article outline and working title in the first instance. We also have an active commissioning program whereby the Commissioning Editor, under the advice of the Editorial Advisory Panel, solicits articles directly for publication.

### **External peer review**

Through a rigorous peer review process, Future Science titles aim to ensure that reviews are unbiased, scientifically accurate and clinically relevant. All articles are peer reviewed by three or more members of the International Advisory Board or other specialists selected on the basis of experience and expertise. Review is performed on a double-blind basis – the identities of peer reviewers and authors are kept confidential. Peer reviewers must disclose potential conflicts of interests that may affect their ability to provide an unbiased appraisal (see Conflict of Interest Policy below). Peer reviewers complete a referee report form, provide general comments to the editor and both general and specific comments to the author(s). Where an author believes that an editor has made an error in declining a paper, they may submit an appeal. The appeal letter should clearly state the reasons why the author(s) considers the decision to be incorrect and provide detailed, specific responses to any comments relating to the rejection of the review. Further advice from members of the journal's Editorial Advisory Panel external experts will be sought regarding eligibility for re-review.

### **Revision**

Most manuscripts require some degree of revision prior to acceptance. Authors should provide two copies of the revised manuscript – one of which should be highlighted to show where changes have been made. Detailed responses to reviewers' comments, in a covering letter/email, are also required. Review manuscripts may be accepted at this point or may be subject to further peer review. The final decision on acceptability for publication lies with the journal editor.

### **Post-acceptance**

Accepted review manuscripts are edited by the in-house Future Science editorial team. Authors will receive proofs of their article for approval and sign off and will be asked to sign a transfer of copyright agreement, except in circumstances where the author is ineligible to do so (e.g. government employees in some countries).

### **Author disclosure & conflict of interest policy**

Authors must state explicitly whether potential conflicts do or do not exist (e.g. personal or financial relationships that could influence their actions) and any such potential conflict of interest (including sources of funding) should be summarized in a separate section of the published review. Authors must disclose whether they have received writing assistance and identify the sources of funding for such assistance. Authors declaring no conflict of interest are required to publish a statement to that effect within the article. Authors must certify that all affiliations with or financial involvement with any organization or entity with a financial interest in or financial conflict with the subject matter or materials discussed in their manuscript have been disclosed. Please note that examples of financial involvement include: employment, consultancies, honoraria, stock ownership or options, expert testimony, grants or patents received or pending and royalties. This list is not exclusive of other forms of financial involvement. Details of relevant conflicts of interests (or the lack of) must be declared in the 'Disclosure' section of the manuscript for all listed authors. External peer reviewers must disclose any conflicts of interest that could bias their opinions of the manuscript, and they should disqualify themselves from reviewing specific manuscripts if they believe it appropriate. Should any such conflict of interest be declared, the journal editor will judge whether the reviewer's comments should be recognized or will interpret the reviewer's comments in the context of any such declaration.

### **Authorship & contributorship**

All authors should meet the ICMJE authorship criteria as follows: (1) they have provided significant input into the design and concept of the study that is the subject of the paper or were pivotal in the acquisition, analysis or interpretation of data; (2) they drafted the paper or were involved in making significant revisions; and (3) they approved the final version of the paper. The corresponding author should accept direct responsibility for the manuscript, including liaising with all authors for their feedback and statements of disclosure, and will be responsible for approval of the final version prior to publication.

### **Ethical conduct of research**

For studies involving data relating to human or animal experimental investigations, appropriate institutional review board approval is required and should be described within the article. For those investigators who do not have formal ethics review committees, the principles outlined in the Declaration of Helsinki should be followed. For investigations involving human subjects, authors should explain how informed consent was obtained from the participants involved.

### **Patients' rights to privacy**

Patients have a right to privacy that should not be infringed without informed consent. Identifying information should not be included unless the information is essential for scientific purposes and the patient (or parent or legal guardian) gives written informed consent for publication. Informed consent for this purpose requires that the patient be shown the manuscript to be published. When informed consent has been obtained it should be indicated in the manuscript. In attempting to maintain patient anonymity, identifying details should be omitted where they are not essential. However, patient data should never be amended or falsified. Informed consent should be obtained whenever there is any doubt that anonymity can be assured.

**Use of personal communications & unpublished data**

Where an individual is identified within a review as a source of information in a personal communication or as a source for unpublished data, authors should include a signed statement of permission from the individual(s) concerned and specify the date of communication.

**Clinical trial registration**

Future Science titles prefer to publish clinical trials that have been included in a clinical trials registry that is accessible to the public at no charge, is electronically searchable, is open to prospective registrants and is managed by a not-for-profit organization, such as [www.clinicaltrials.gov](http://www.clinicaltrials.gov) (sponsored by the United States National Library of Medicine). Whilst referees will take registration status into account, all well designed and presented trials and corresponding data will be considered for publication.

**Errata/corrigenda**

Mistakes by either editor or author should be identified wherever possible and an erratum or corrigendum published at the earliest opportunity. We will attempt to contact the author of the original article to confirm any error, and publish an appropriate erratum or corrigendum at the earliest opportunity.

**Permissions for reproduced or adapted material**

Authors must acknowledge the origin of all text, figures, tables or other information that has been adapted or reproduced from other publications. Authors must provide a copy of the original source documents and should submit permission from the authors of the original work and the original publishers for unlimited use in all markets and media (that includes both electronic and print use in any language).

**Duplicate publication/submission & plagiarism**

All manuscripts submitted to Future Science titles are considered for publication on the understanding that they have not been published previously elsewhere or are under consideration for publication elsewhere. The journal may, however, consider republication of a paper previously published in a language other than English, subject to prominent disclosure of the original source and with any necessary permission. Authors will be asked to certify that the manuscript represents valid work and that neither this manuscript nor one with substantially similar content under their authorship has been published or is being considered for publication elsewhere, except as described in an attachment, and copies of closely related manuscripts are provided. All submitted articles will be evaluated using plagiarism detection software, which compares the submitted manuscript with full text articles from all major journals databases and the internet. The use of published or unpublished ideas, words or other intellectual property derived from other sources without attribution or permission, and representation of such as those of the author(s) is regarded as scientific misconduct and will be addressed as such.

**Misconduct**

If misconduct by authors or reviewers is suspected, either pre- or post-publication, action will be taken. An explanation will be sought from the party or parties considered to be involved. If the response is unsatisfactory, then an appropriate authority will be asked to investigate fully. Future Science will make all reasonable attempts to obtain a resolution in any such eventuality and correct the record or archive as necessary.

# More targets. More accurately. Faster than ever.

Analytical challenges grow in quantity and complexity. Quantify a larger number of compounds and more complex analytes faster and more accurately with our new portfolio of LC-MS instruments, sample prep solutions and software. High-resolution, accurate mass solutions using Thermo Scientific™ Orbitrap™ MS quantifies all detectable compounds with high specificity, and triple quadrupole MS delivers SRM sensitivity and speed to detect targeted compounds more quickly. Join us in meeting today's challenges. Together we'll transform quantitative science.
